# **1.INTRODUCTION**

## **Purpose:**

The purpose of this document is to build an online system to ship, track and deliver the product to user in reliable way or in time.

Courier Management System is the simplest solution for Courier & Cargo Tracking Business. This Courier Management System project will have different modules. The login section will have login facility for the admin who will operate this system and online tracking system of consignment and shipping detail for domestic shipping. While taking orders from its customers, it will take all the details of its customers who is placing the orders and all the details for the recipient such as its address, name ,mobile number.

During billing process, system generates a consignment number for their products. Through this consignment no. customers or its recipient will able to track their products from any location using internet . It will provide status of the product after placing orders.

This Courier Management System project will provide information recipient with following detail – where the current consignment is till when it will reached its final destination, date of placing consignment, final date to reach its destination etc

## **2.SCOPE**

Courier management is the process of organizing last-mile delivery operations. Courier management involves scheduling order deliveries and assigning them to couriers, overseeing operations, planning and optimizing routes, overseeing vehicles, managing fuel, and handling courier expense approvals.

The main objective of the Courier Management System is to manage the details of Courier ,Email Notification ,Payment ,Delivery ,Customer. It manages all the information about Courier, Bill, Customer, Courier. The project is totally built at administrative end and thus only the administrator is guaranteed the access.

It improves customer experience through better engagement, real-time order tracking, communication and much more. With AI-enabled algorithms and integrated dashboards that can be customized, courier management software minimizes the time, effort, and resources required to ensure efficient deliveries.

## **3. REQUIREMENT SPECIFICATION**

### **3.1 HARDWARE SPECIFICATION**

Processors will continue to get faster, smaller and cheaper whereas memory will continue to get faster, larger and cheaper. The trend except to have a reasonable memory to a powerful processor.

Processor	:	11th Gen Intel(R) Core (TM) i3
Ram	:	1GB RAM
Hard Drive	:	160 GB
Monitor	:	16 INCHES
Keyboard	:	104 keys
Mouse	:	Logitech Optical Mouse

### **3.2 SOFTWARE SPECIFICATION**

When an application project is considered the three basic software requirements are the platform in which the project is developed, the front-end tool that provides the interaction with the users and the back-end tool that stores the data.

Operating System	:	Windows11
Front-end	:	Visual Studio, Chrome
Back-end	:	MySQL , PHP

## **3.3 FEATURES OF TRACKING IN ONLINE SYSTEM**

### **InboundTracking**

In addition to a variety of tracking options, you'll receive FedEx Ship Alert® notifications for pickups, deliveries and exceptions.

### **StandardRates**

Packages are rated with both discount and standard rates from a single-rate request to help you predict shipping costs.

### **Flexibility**

You can customize and integrate the user interface with your existing business systems. You also get convenient delivery of FedEx Express® and FedEx Ground® shipments to more than 1,900 FedEx Office locations via our service.

### **ScalableTechnology**

Adapt and expand to fit your customers' changing needs. A single installation of FedEx Ship Manager Server can support a large number of shipping origins, accounts and meters, regardless of location.

### **ACustomizableInterface**

FedEx Ship Manager Server is a transaction-based application that does not have a predetermined graphical user interface (GUI). That means you can develop an interface that meets your specific needs and preferences.

### **ThoroughDocumentation**

You can access detailed user documentation with full descriptions on all key features and transactions, and develop greater awareness of customers' shipping activity through daily shipping reports.

### **Self-ContainedShipping**

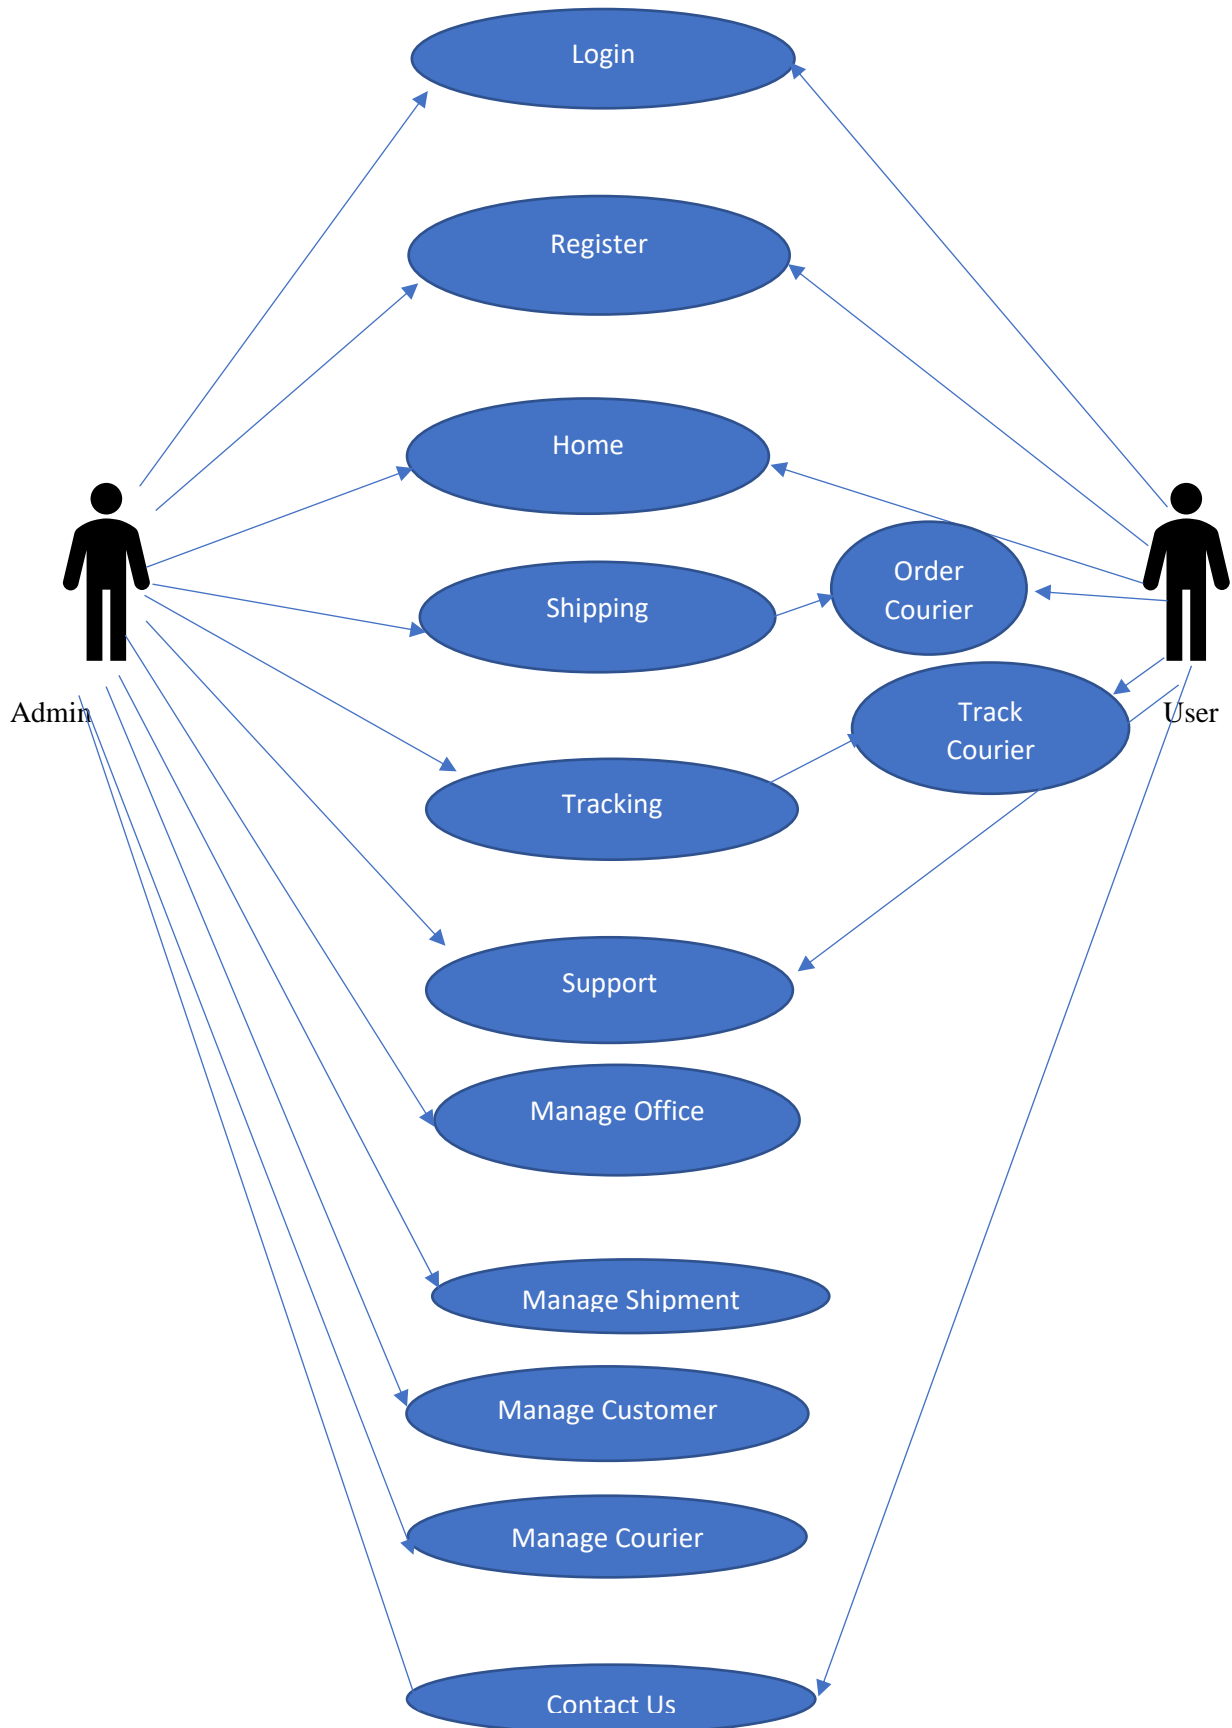

All shipping functionality is contained within the FedEx Ship Manager Server application, preventing the need for constant communications with FedEx systems to perform vital shipping functions. You get greater application speed and fewer security risks from point-to-point electronic communications.

### **GlobalAvailability**

Ship to and from any FedEx served origin and destination. You also have fast, global return service to help streamline your international shipping operations.

## 4.SYSTEM DESIGN

### 4.1. Use Case Diagram

### 4.1.1:USECASE DISCRIPTION

Use-case diagrams **describe the high-level functions and scope of a system**. These diagrams also identify the interactions between the system and its actors. The use cases and actors in use-case diagrams describe what the system does and how the actors use it, but not how the system operates internally.

The main purpose of a use case diagram is to portray the dynamic aspect of a system. It accumulates the system's requirement, which includes both internal as well as external influences. It invokes persons, use cases, and several things that invoke the actors and elements accountable for the implementation of use case diagrams. It represents how an entity from the external environment can interact with a part of the system.

SR. No	USECASE	ACTOR	DISCRIPTION
1	Login	Admin, User	Enter Username and password
2	Register	Admin, User	Enter Username, Email Id, Password
3	Contact Us	Admin, User	Enter Username, Email Id Password, Query

### 4.1.2:USECASE EXPLAINATION

#### Use case 001: login

INTORDUCTION: this use case outlines the step that need to be followed in order to login into the system.

Start

ACTOR: Administrator, Student (user)

PRE-CONDITION: user has to have a valid credential

POST- CONDITION: the system display the relevant page

BASIC FLOW: the user enter the user name and password

SCENARIO:

ACTOR	SOFTWARE REACTION
Username , password	If it is valid user can enter into system If it is invalid user it indicates it is wrong user name or password

ALTERNATE FLOW: the user can enter the Email Id

SPECIAL REQUIREMENTS: None

ASSOCIATED USE CASE(S): None

#### Use case 002: Registration

INTORDUCTION: this use case outlines the step that need to be followed in order to register form

ACTOR: student (user) and admin.

PRE-CONDITION: user has to have a valid credential

POST-CONDITION: the system display the relevant page

BASIC FLOW: the system confirms that the entered details is correct or not.

Scenario:

ACTOR	SOFTWARE REACTION
Username Email Id Password	The system verifies that the above items has been filledout If any data is missing, the system warns the user If all data has been entered the system ask the user to checkalldata. If all data filled then click on register.

ALTERNATE FLOW: None

SPECIAL REQUIREMENTS: None

ASSOCIATED USE CASE(S): None

### Use case 003: Contact us

INTORDUCTION: this use case outlines the step that need to be followed in order to fill out the data

ACTOR: student (user) and admin

PRE-CONDITION: user has to have a valid credential

POST-CONDITION: the system display the relevant page

BASIC FOLW: the user enter the details.

ACTOR	SOFTWARE REACTION
Firstname Lastname Emailid Password Address Subject Query	If all data is filled then system will give you expected solution of that query.

ALTERNATE FLOW: click on customer support

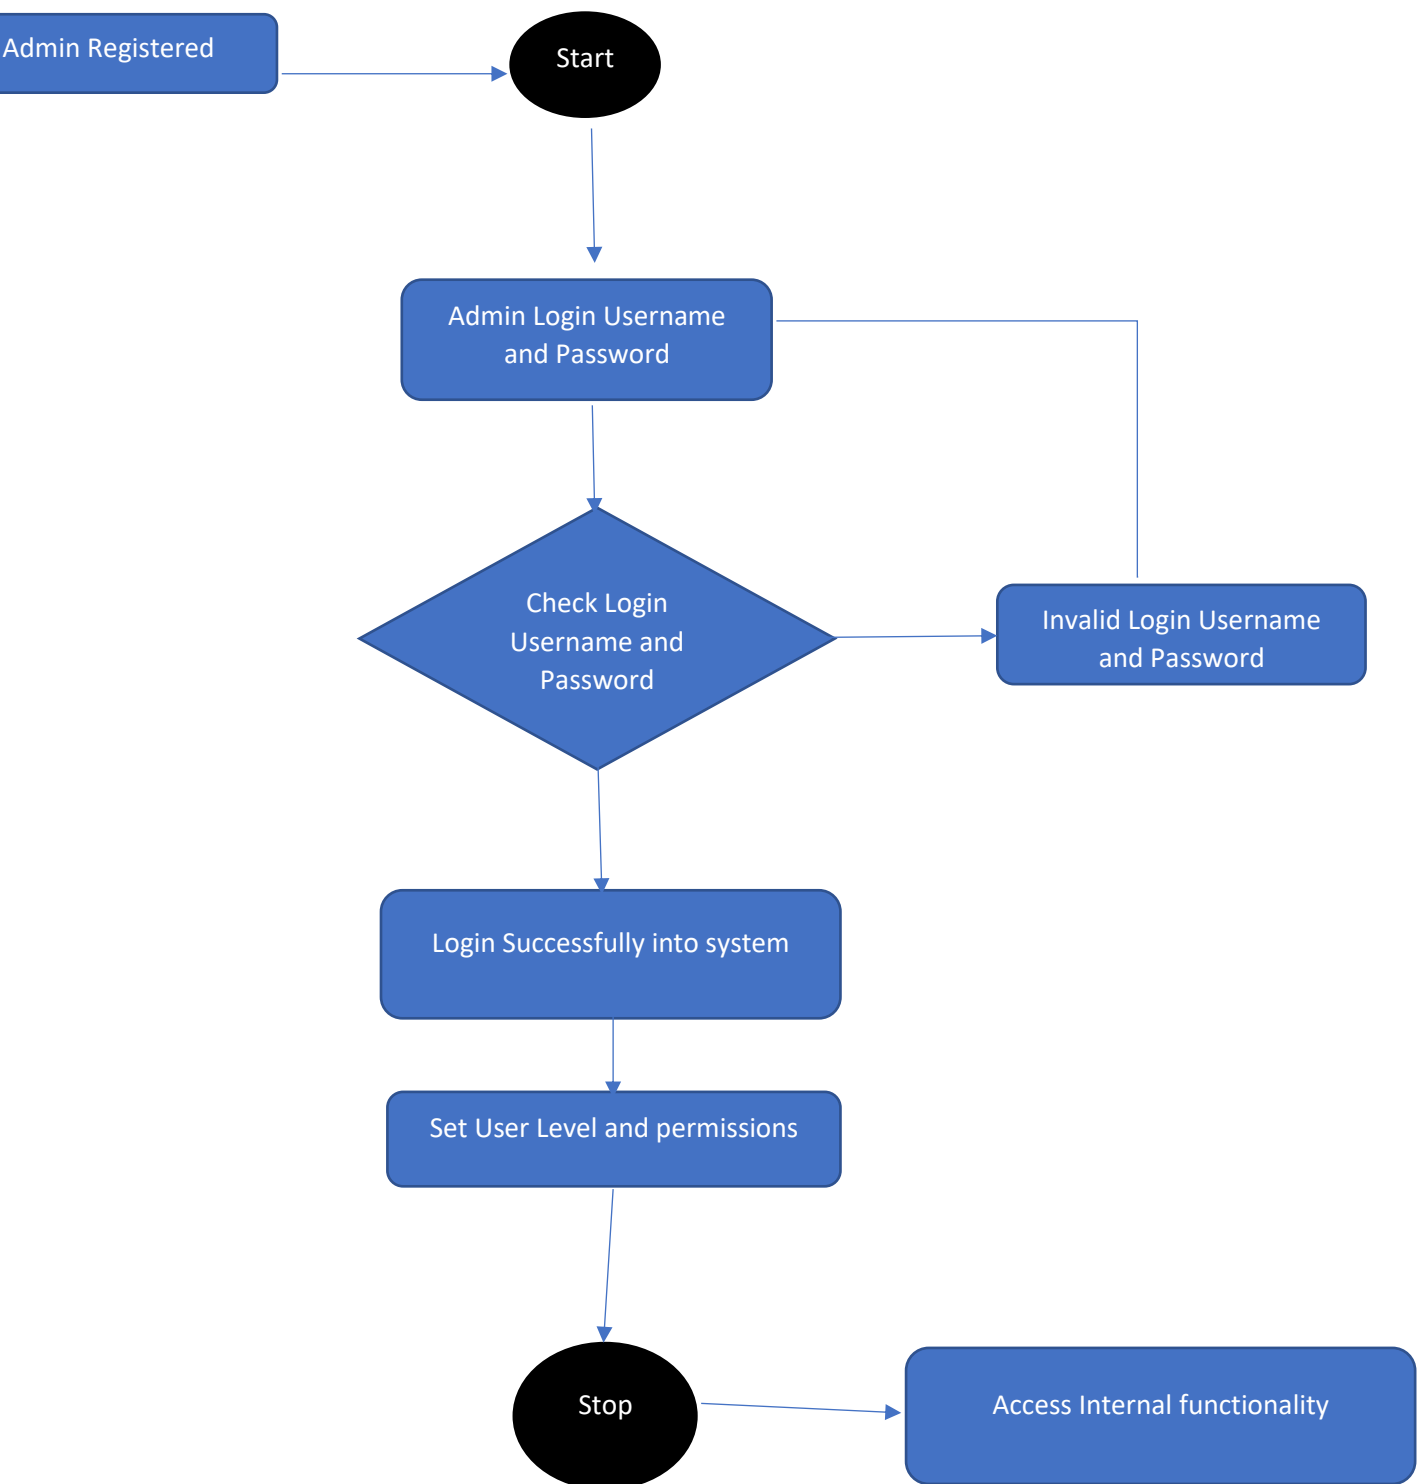

SPECIAL REQUIREMENTS: None

ASSOCIATED USE CASE(S): None

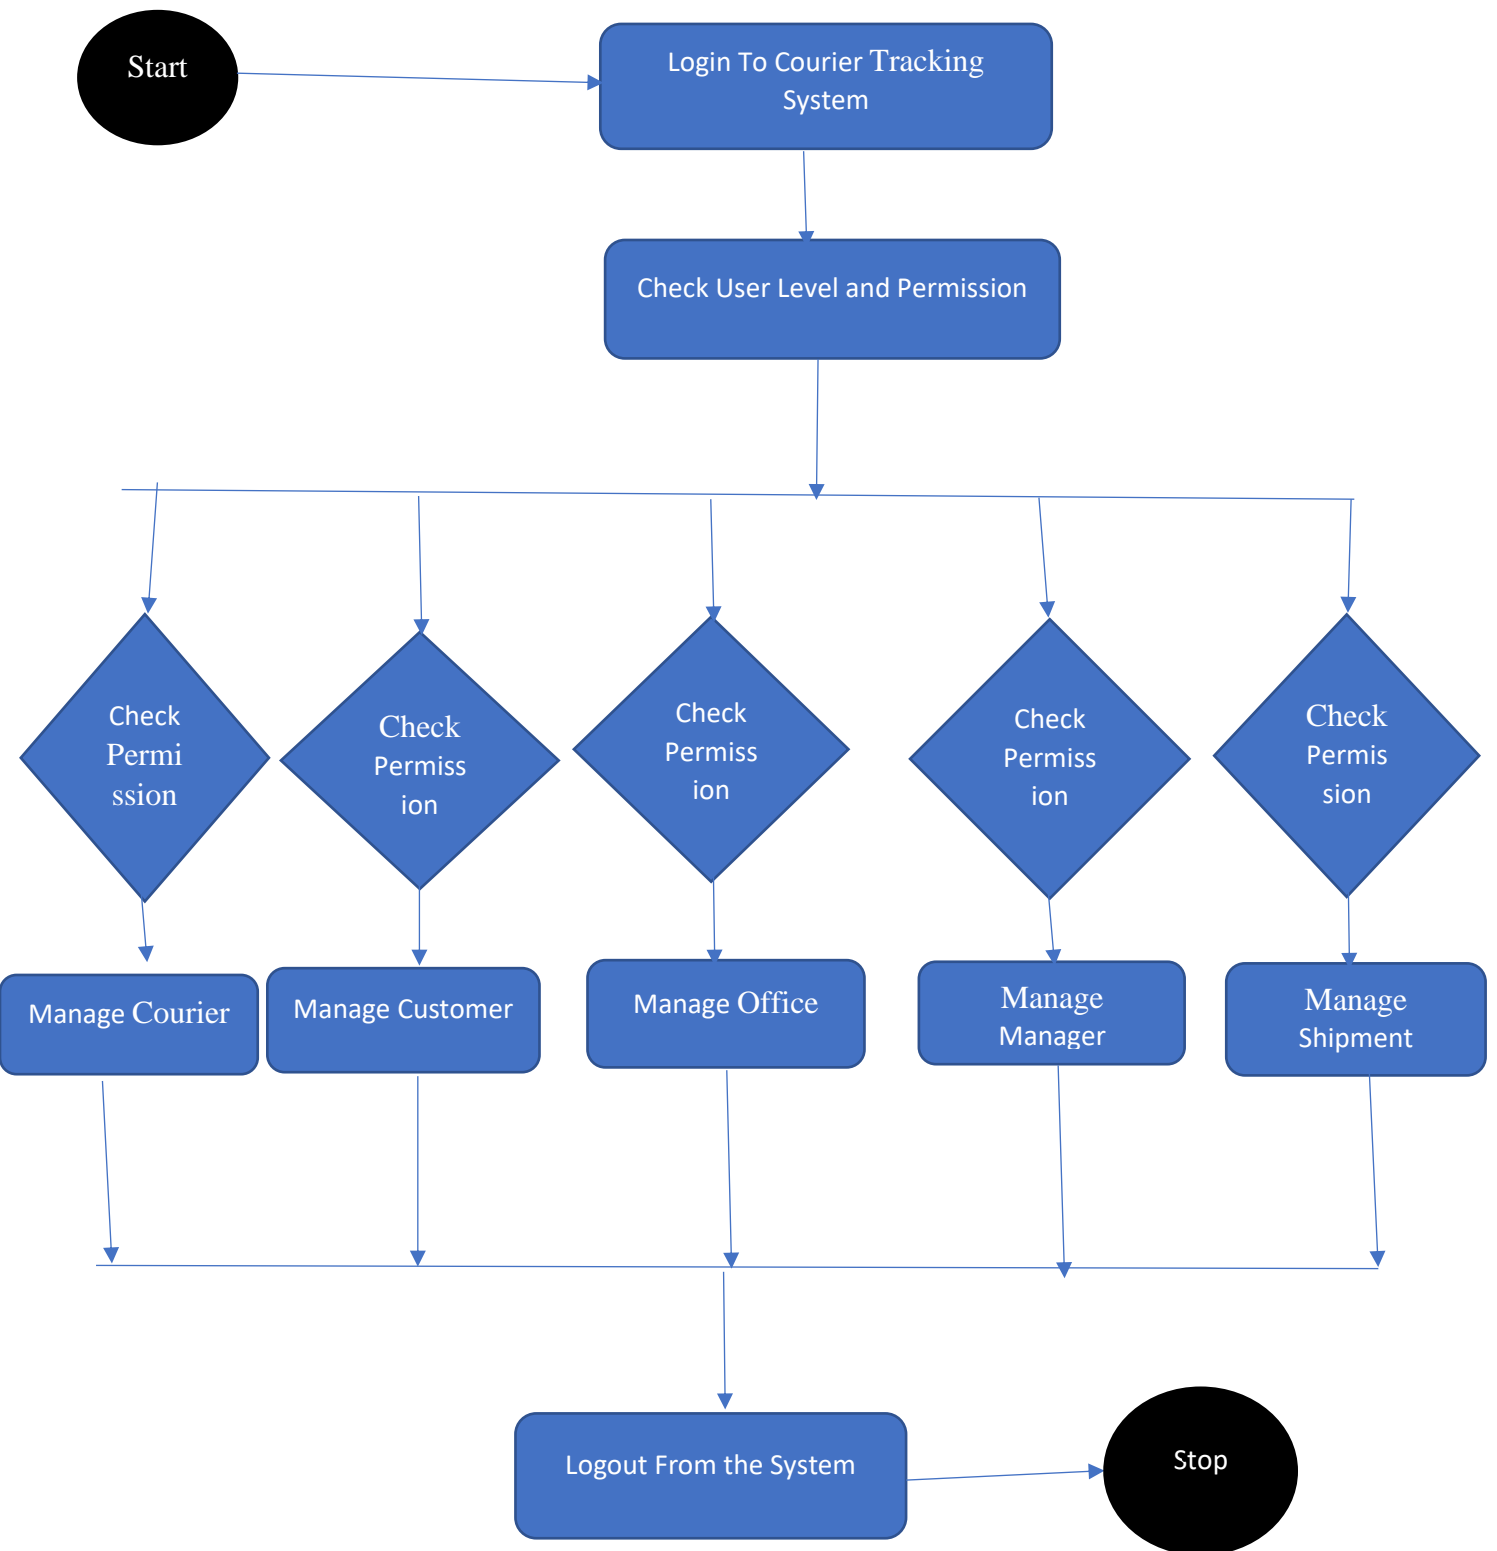

## 4.2.Activity Diagram

An activity diagram shows online and software processes as a progression of actions.

### Login Activity Diagram

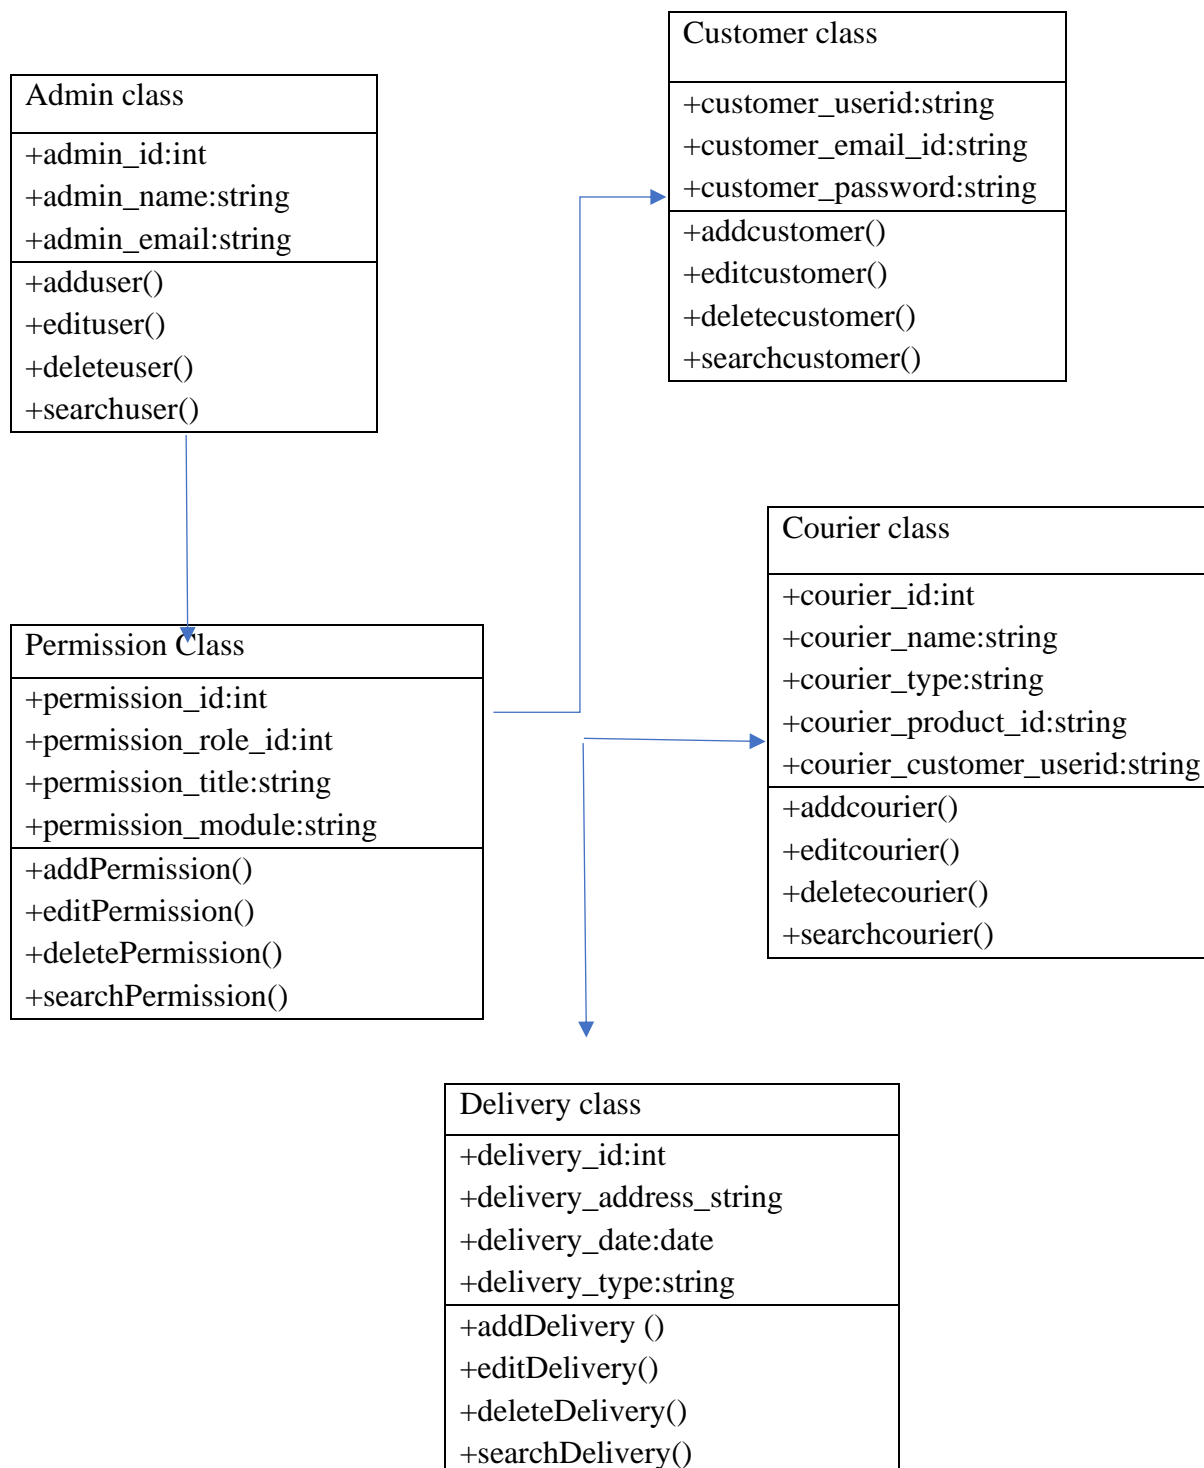

## Activity diagram of Courier Tracking System

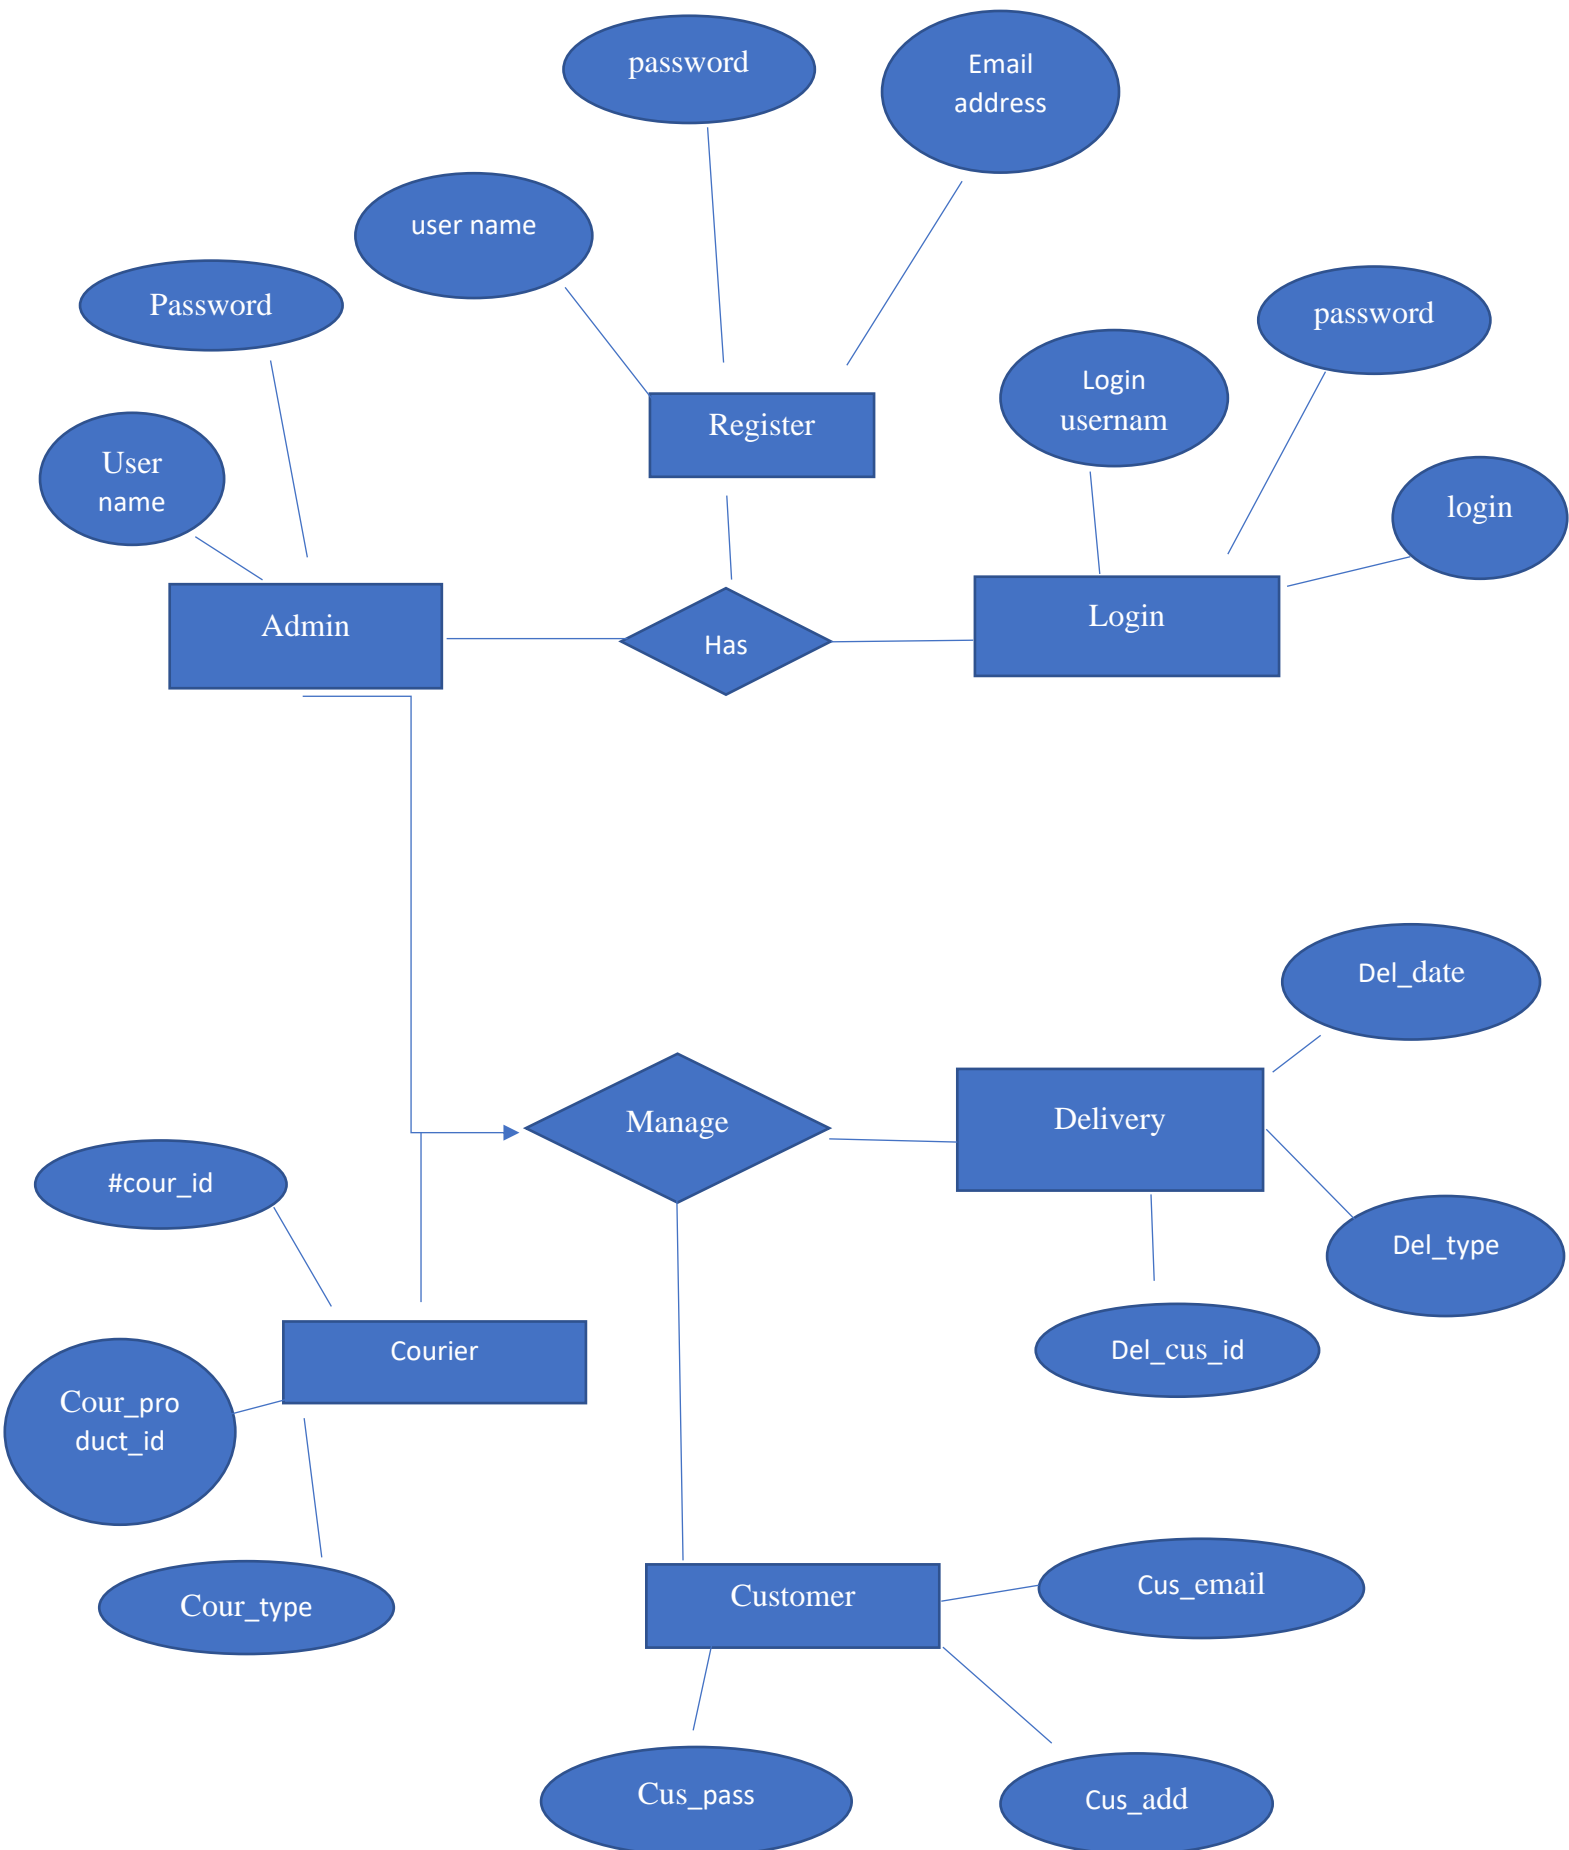

### 4.3.ClassDiagram

The purpose of class diagram is to model the static view of an application. Class diagrams are the only diagrams which can be directly mapped with object-oriented languages and thus widely used at the time of construction.

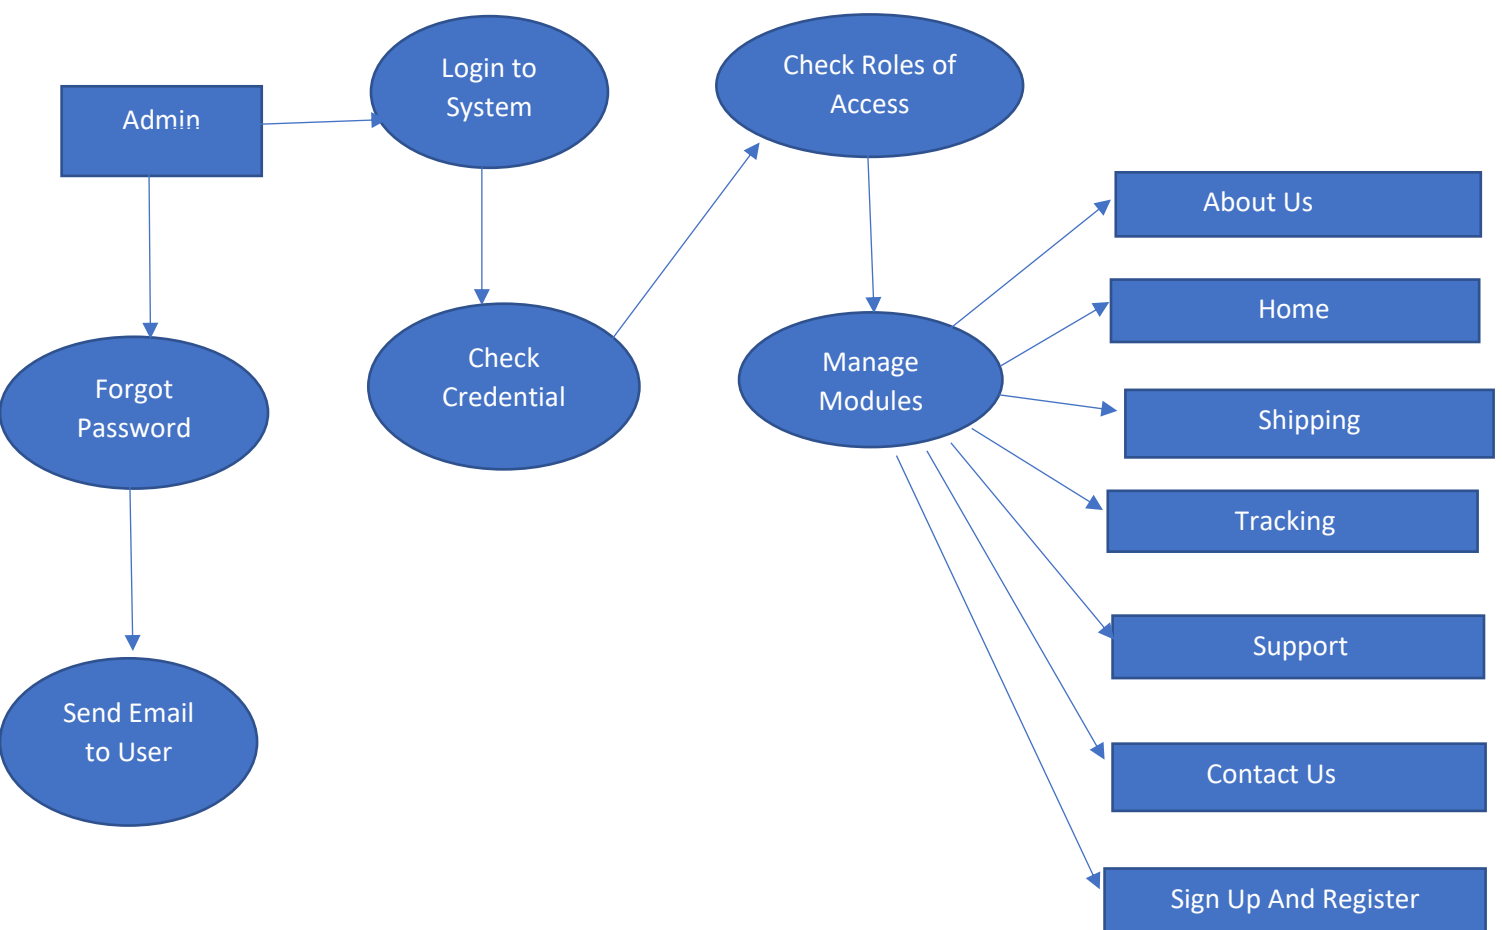

#### 4.4.ER Diagram

## 4.5.Data Flow Diagram

A data flow diagram (DFD) is a graphical model the show all of the main requirement For an information system in a diagram : input and output, process, and data storage. A DFD Describe what data flows rather than how it is processed. Everyone working on a development project can see all aspects of the system working Together at once with DFD. That is one of the reason for its popularity, the DFD is also easy To read because it is graphical model. The DFD is mainly used during problem analysis. End DFD with minimaltraining.

# **5.IMPLEMENTATION**

## **DESCRIPTION OF MODULES**

### **5.1 Module**

In this website I have created the online product to deliver, to track that product to customer. The name of my project is to.

In website I have to include home, about us, shipping etc.....

About FedEx

Home

Shipping

Tracking

Support

Signup and Login

### **5.2 Front End Design:**

In that front end design, I have used HTML, CSS and JavaScript.

### **5.3:HTML**

(Hypertext Markup Language)

HTML stands for Hyper Text Markup Language. It is used to design web pages using a markup language. HTML is the combination of Hypertext and Markup language. Hypertext defines the link between web pages. A markup language is used to define the text document within the tag which defines the structure of web pages.

This language is used to annotate (make notes for the computer) text so that a machine can understand it and manipulate text accordingly. Most markup languages (e.g. HTML) are human-readable. The language uses tags to define what manipulation has to be done on the text.

### **5.4:HTML page structure:**

The basic structure of an HTML page is laid out below. It contains the essential building-block elements (i.e. doctype declaration, HTML, head, title, and body elements) upon which all web pages are created

## 5.5:CSS

( Cascading Style Sheet )

Cascading Style Sheets, fondly referred to as CSS, is a simply designed language intended to simplify the process of making web pages presentable. CSS allows you to apply styles to web pages. More importantly, CSS enables you to do this independent of the HTML that makes up each web page.

It describes how a webpage should look: it prescribes colors, fonts, spacing, and much more. In short, you can make your website look however you want. CSS lets developers and designers define how it behaves, including how elements are positioned in the browser.

While html uses tags, CSS uses rulesets. CSS is easy to learn and understand, but it provides powerful control over the presentation of an HTML document.

**CSS saves time:** You can write CSS once and reuse the same sheet in multiple HTML pages.

**Easy Maintenance:** To make a global change simply change the style, and all elements in all the webpages will be updated automatically

**Search Engines:** CSS is considered a clean coding technique, which means search engines won't have to struggle to "read" its content.

**Superior styles to HTML:** CSS has a much wider array of attributes than HTML, so you can give a far better look to your HTML page in comparison to HTML attributes.

**Offline Browsing:** CSS can store web applications locally with the help of an offline cache. Using this we can view

**offline websites**

## 5.6:JAVASCRIPT

JavaScript is a lightweight, cross-platform, and interpreted compiled programming language which is also known as the scripting language for webpages. It is well-known for the development of web pages, many non-browser environments also use it. JavaScript can be used for CLIENT-SIDE developments as well as SERVER\_SIDE developments.

JavaScript is both imperative and declarative type of language. JavaScript contains a standard library of objects, like array, date and math, and a core set of language elements like operators, control structures, and statements. AngularJS is a JavaScript framework. It can be added to an HTML page with a `<script>` tag.

AngularJS extends HTML attributes with Directives, and binds data to HTML with Expressions. AngularJS is a JavaScript Framework. AngularJS is a JavaScript framework written in JavaScript.

AngularJS is distributed as a JavaScript file, and can be added to a web page with a script

```
tag:<scriptsrc="https://ajax.googleapis.com/ajax/libs/angularjs/1.6.9/angular.min.js">
</script>
```

AngularJS is a JavaScript framework. It can be added to an HTML page with a `<script>` tag. AngularJS extends HTML attributes with Directives, and binds data to HTML with Expressions. AngularJS Extends HTML. AngularJS extends HTML with ng-directives.

The ng-app directive defines an AngularJS application. The ng-model directive binds the value of HTML controls (input, select, text area) to application data.

## 6:CODING

### 6.1:HTML CODE:

#### Main Page Code:

```

## 6.3:SYSTEM OUTPUT:

### About us

In About Us Connecting people with goods, services and ideas creates opportunities and improves lives. At FedEx, we believe that a connected world is a better world, and that belief guides everything we do.

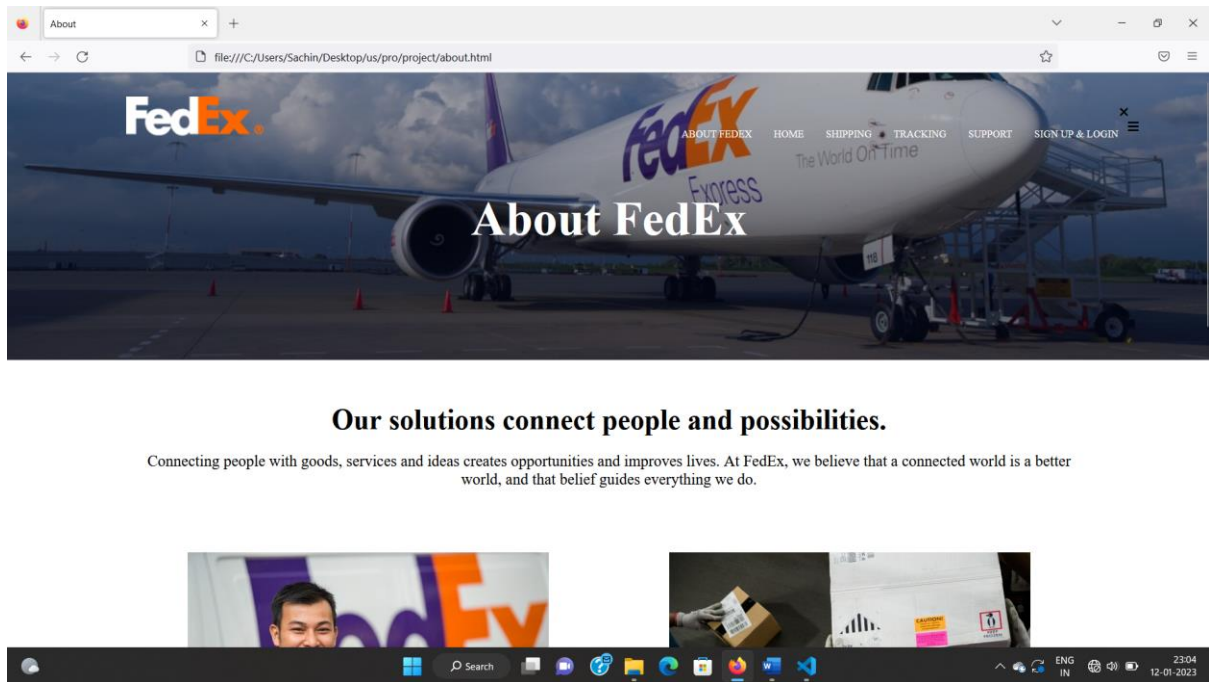

Figure 1.1 About FedEx page

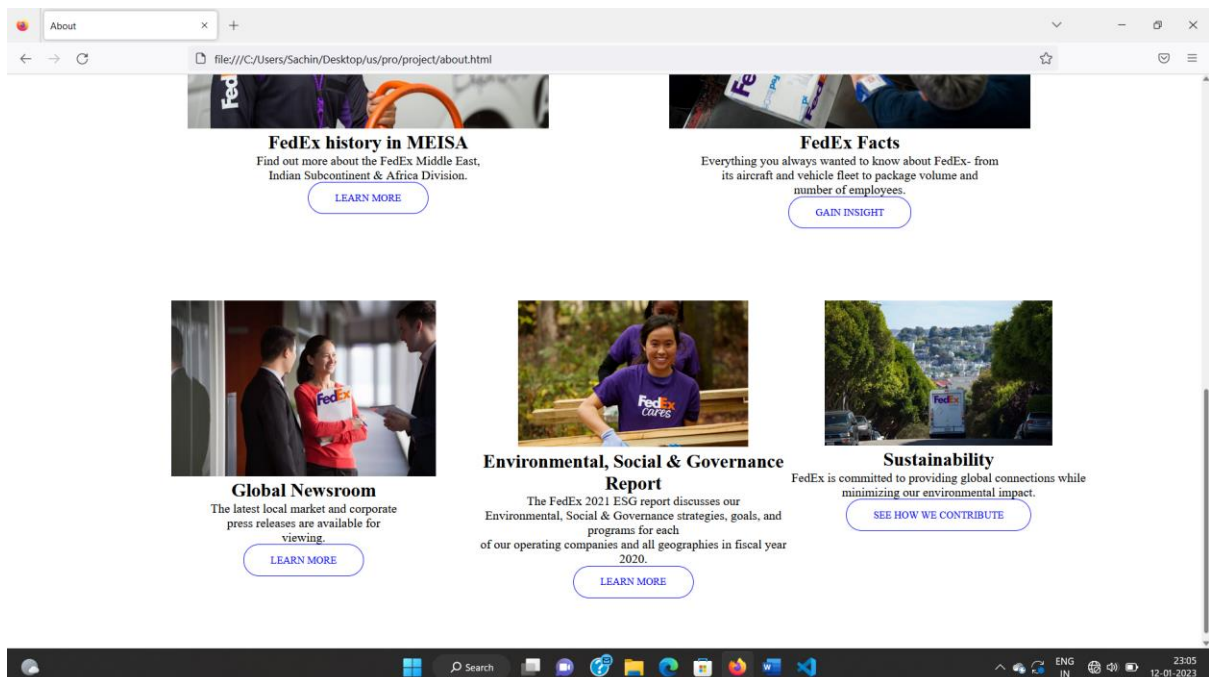

Figure 1.2 About FedEx page

## Home

In Home We provide information about how the FedEx recognise and report fraud users. First we provide Common Warning Signs of Mail, Text or Online Scams and what to do if you receive such communications.

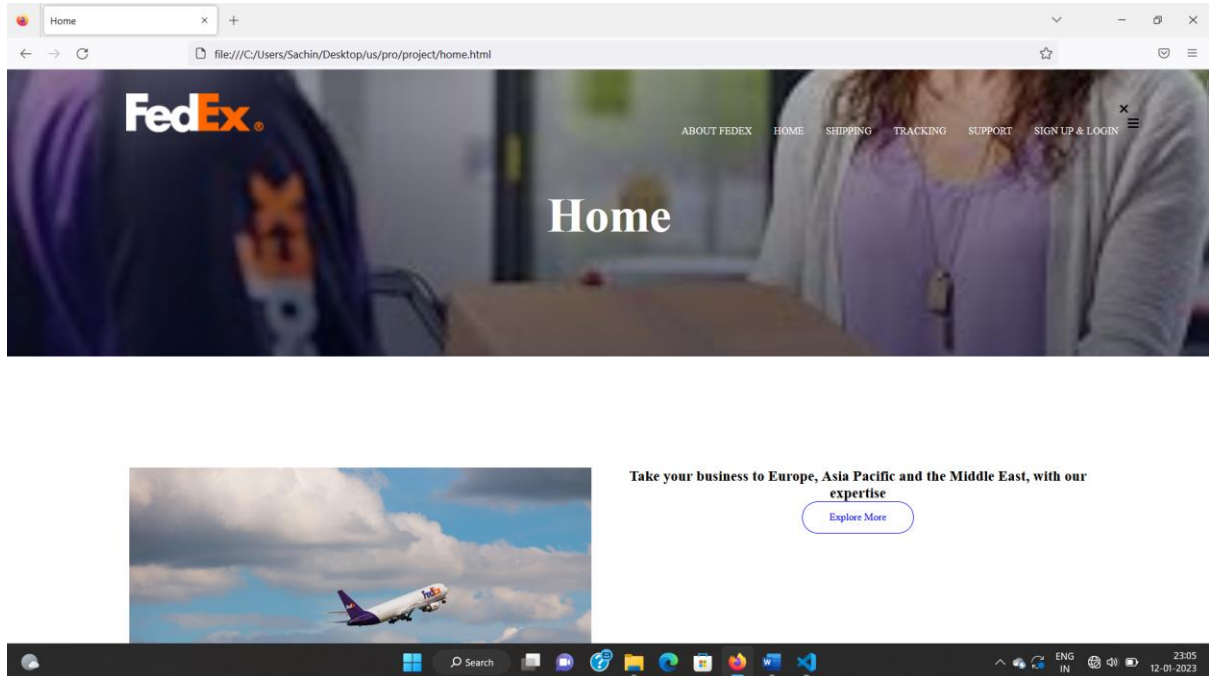

Figure 2.1 Home Page

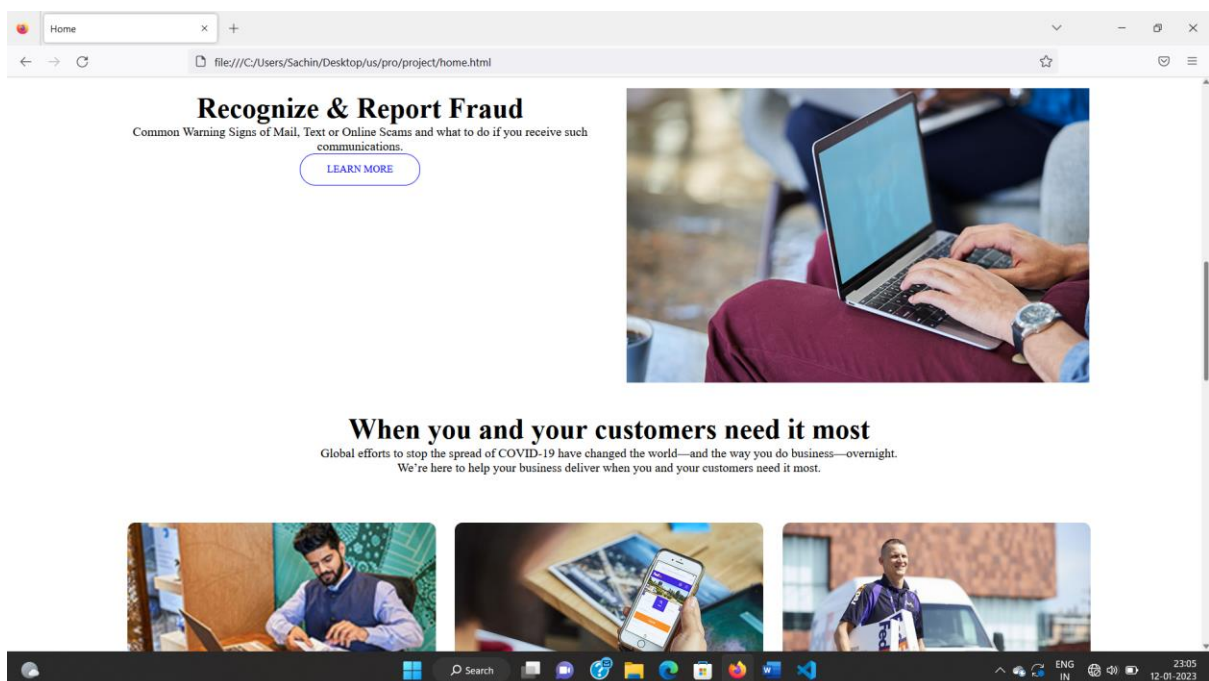

Figure 2.2 Home Page

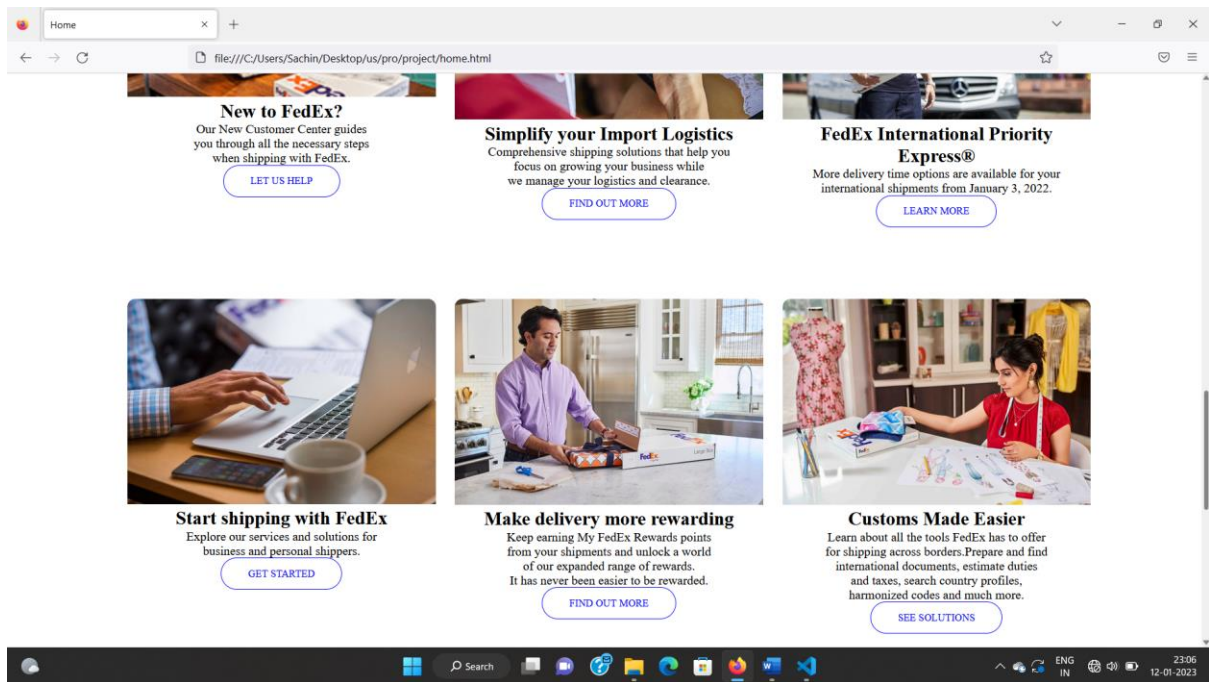

Figure 2.3 Home Page

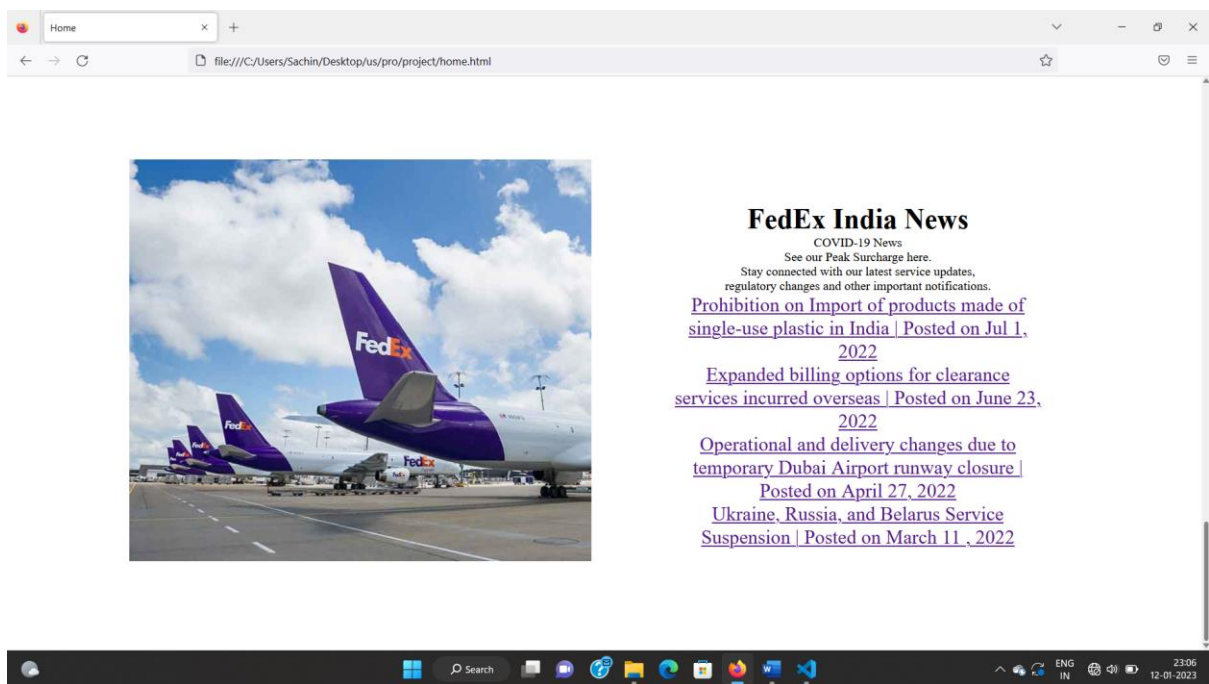

Figure 2.4 Home page

## Shipping

In Shipping We provide the information about shipping tools available on website. We mostly focus on safe shipping courier.

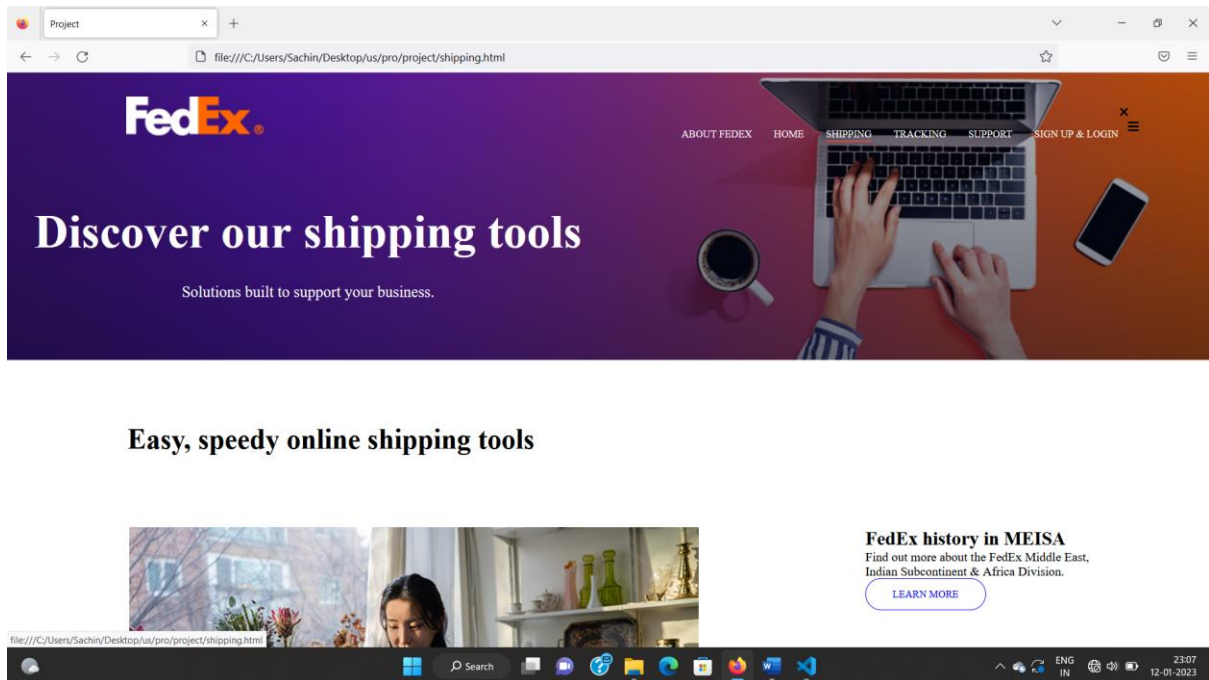

Figure 3 Shipping page

## Tracking

FedEx does not request, via unsolicited call, mail, text or email, payment or personal information in return for goods in transit or in FedEx custody. If you receive any of these or similar communications, do not reply or cooperate with the sender. If your interaction with the website resulted in financial loss, you should contact your bank immediately. You should also consider lodging a complaint with the cybercrime police in your city immediately.

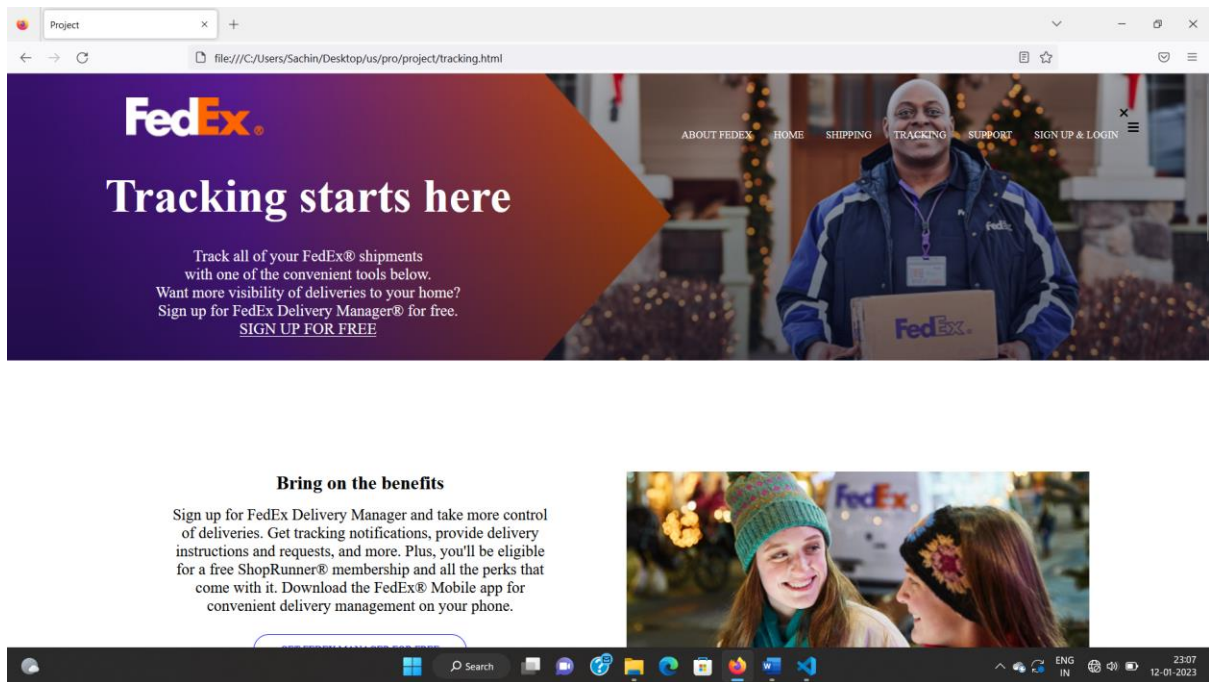

Figure 4.1 Tracking page

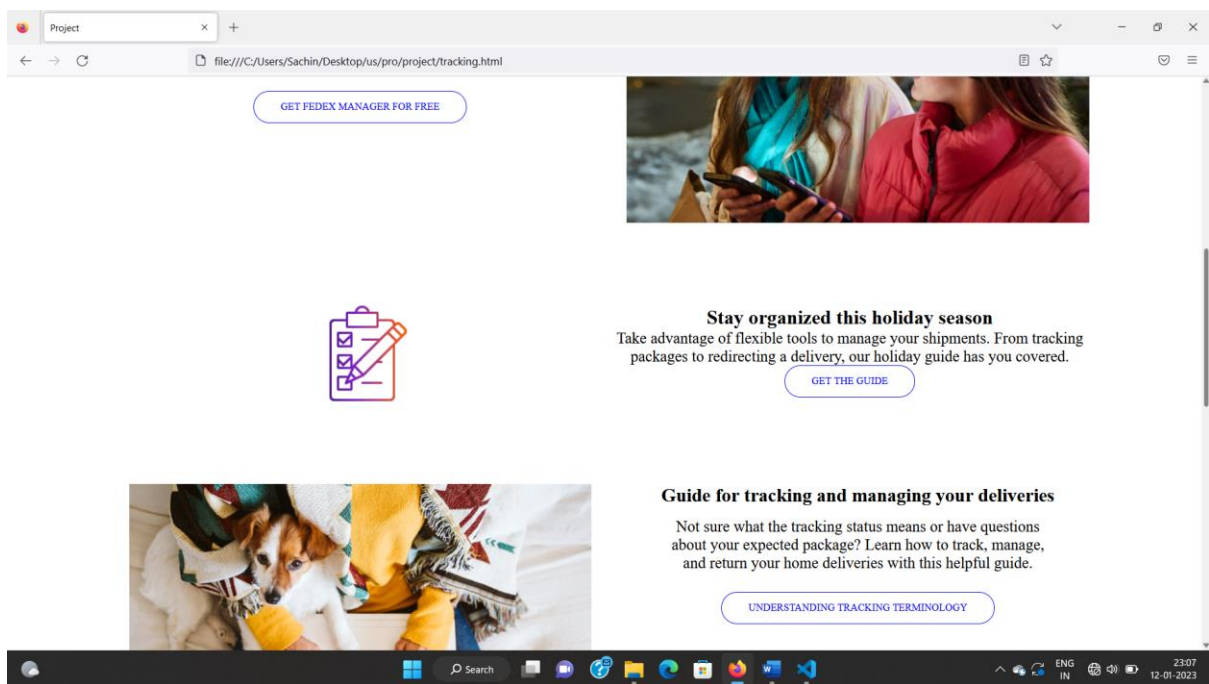

Figure 4.2 Tracking page

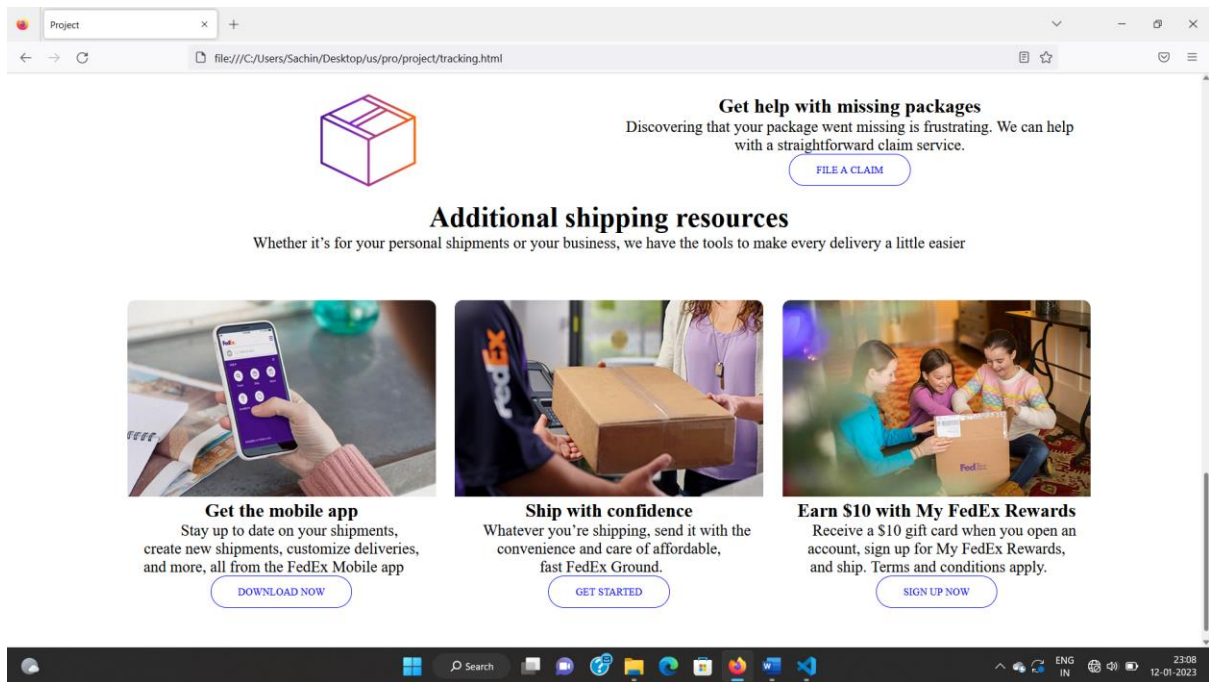

Figure 4.3 Tracking page

## Support

In Support, We provide that how we can support to customer and to resolve their problems. We can clear all consequence of customer regarding our service.

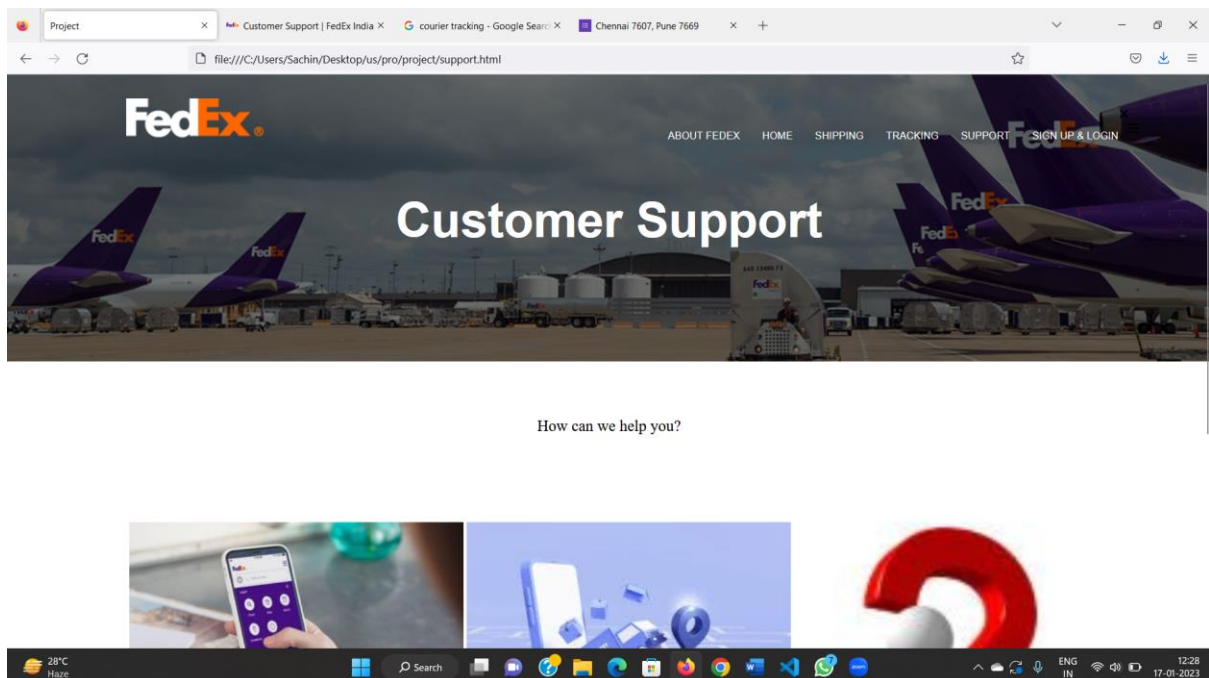

Figure 5.1 customer support

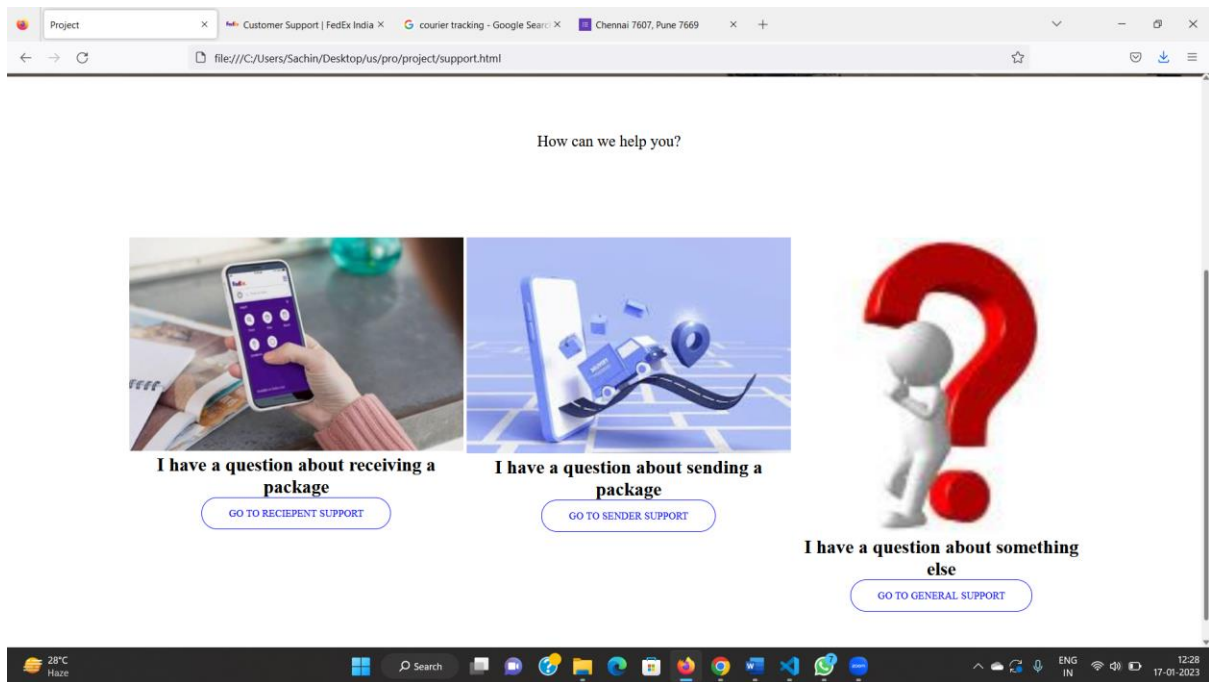

Figure 5.2 customer support

## Sign Up and Login

In Sign Up and Login , We provide Sign up page for new user and login page for already exist users.

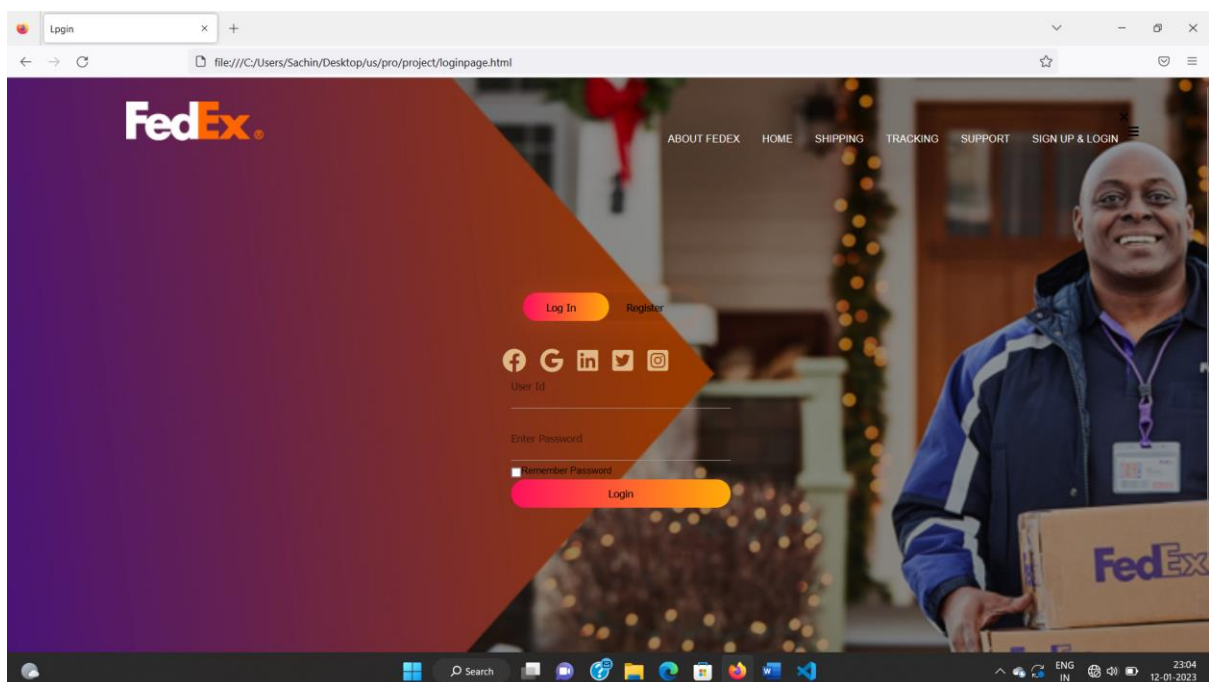

Figure 6.1 login page

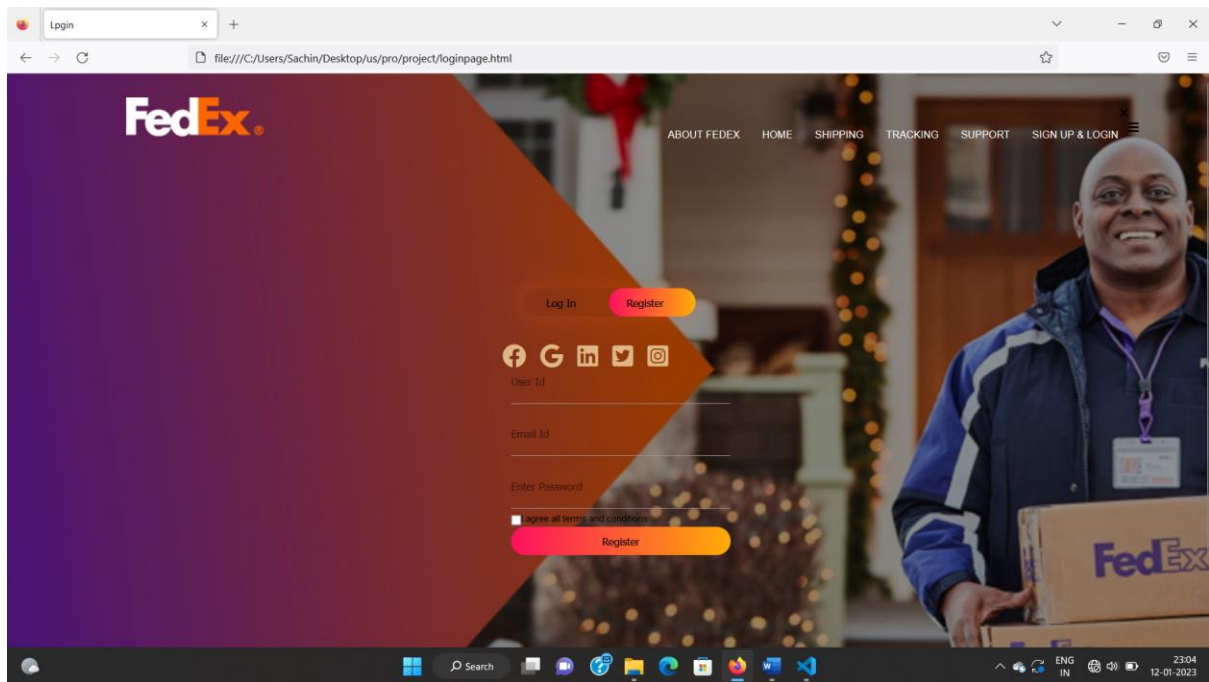

Figure 6.2 Registration page

## 7.SYSTEM TESTING

### 7.1: Type Of testing: -

#### 7.1.1.Unit testing: -

A unit test is a way of testing a unit - the smallest piece of code that can be logically isolated in a system. In most programming languages, that is a function, a subroutine, a method or property. The isolated part of the definition is important.

#### 7.1.2. Integration Testing

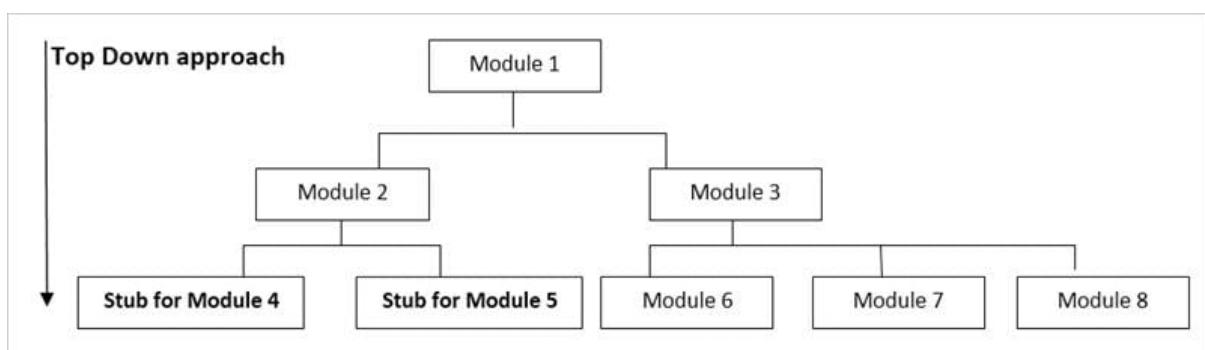

Integration testing is the testing when two or more modules are integrated or merged to test if the product works fine. Modules are integrated in a planned manner as per the integration plan.

#### Approaches used in Integration Testing are:

1. Top-Down approach
2. Bottom-up approach
3. Mixed approach
4. Big Bang approach

#### Top-down approach

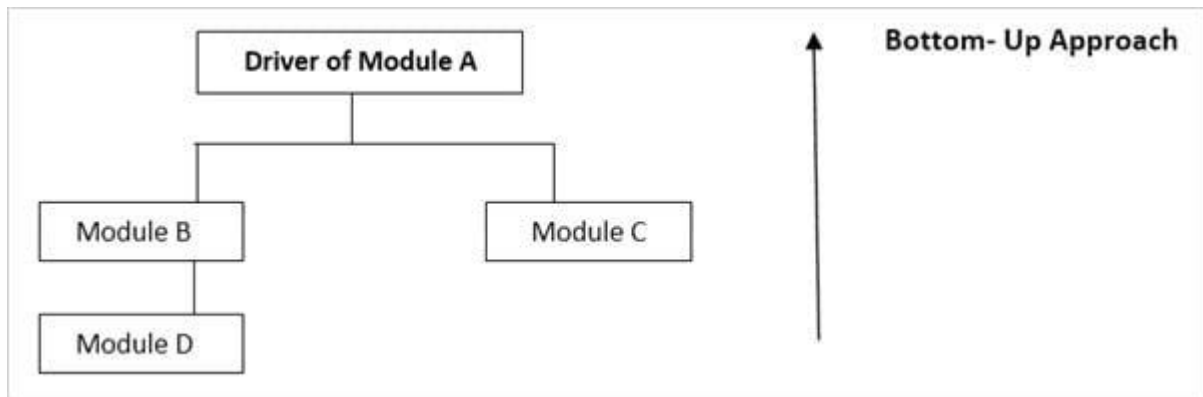

In Top-down integration testing, the top-level module is developed and tested first. After that immediate sub-modules are integrated with the top-level module and are tested. Stubs are required to complete the integration testing with a top-level module in case the module to be integrated is not developed and tested.

To test module 2 in integration testing when modules 4 & 5 are not developed, stubs are created to test the same in the top-down approach.

### Bottom-up Approach

In the bottom-up approach, sub-modules are developed and tested first and the whole system is tested.

To test Module C, the Driver of module A is created so that function can be called.

### Mixed Approach

The mixed approach is a **combination of both top-down and bottom-up** approaches. In the top-down approach, testing can start only when the top modules are developed and the unit tested.

Same way, bottom-up approach testing, can start only when the modules at the bottom have been developed and tested. The mixed approach overcomes this shortcoming as in the mixed approach, testing can start anytime once the modules are developed.

### Big Bang Approach

In the Big bang **approach, all the modules are integrated** into one go and are tested. A drawback of this method is that if any error is detected while testing, it would be difficult to find the error-causing module. Once the defect cause is detected, it will be fixed but it would cost high & will be time-consuming as the defect found is at a later stage.

### 7.1.3. System Testing

In system testing, a system as a whole i.e. a completely developed system is tested to find defects. All the modules are integrated to test as a complete system. Scenarios prepared for system testing are run to find the defects.

All the modules of a product are integrated and tested to verify that the built product is as per the customer requirement. End-to-end testing is performed to cover the complete scenarios.

### 7.1.4. Acceptance Testing

Once the System testing is complete, the Product is ready to be released to the Production environment. But before deployment, the customer's acceptance and approval are required. The customer verifies whether the product is all that they wanted or not. For this acceptance testing is done.

#### Types of Acceptance Testing:

##### Alpha Testing:

Alpha testing is done internally by the members of the company who developed the product. This testing is not performed by the developers and testers who developed and tested the product.

##### Beta Testing:

Beta testing is done by the actual users in the Production environment. Beta version of the application is released in the real environment to get feedback from the users which indeed helps to reduce the chances of failure of the product in the production environment.

##### User Acceptance Testing:

Testing is done at the user end wherein the prepared UAT test cases are executed. Replica of the production environment is created for the customer to perform the user acceptance testing.

### **7.1.5. Non -functional testing**

Non-functional testing is done to verify the non-functional aspects of a product. **E.g.** Performance of any product comes under non-functional activity.

Non-functional testing is as important as functional testing is. If it is not done properly, it can lead to major issues in the Product.

#### **Example:**

If Performance testing is not done for new functionality added to the application, when the application goes live it becomes too slow to work with and the customer gets affected with the same.

#### **Types of Non-functional Testing**

- Performance Testing
- Load Testing
- Stress Testing
- Volume Testing
- Security Testing
- Usability Testing
- Compatibility Testing
- Installation Testing
- Uninstallation Testing
- Recovery Testing
- Documentation Testing

## 7.2TESTCASE

Testcase for Courier Tracking By ID Website.

Project Name: Courier Tracking

Reference: Project Functionality Requirement Specification

Created By: <http://www.fedex.com>

Date of created: 01-October -2022

Date of review: 19-January -2023

## **7.3 WEBSITE AUTOMATION TEST USING SELENIUM**

Automation Testing is a software testing technique that performs using special automated testing software tools to execute a test case suite. On the contrary, Manual Testing is performed by a human sitting in front of a computer carefully executing the test steps.

The automation testing software can also enter test data into the System Under Test, compare expected and actual results and generate detailed test reports. Software Test Automation demands considerable investments of money and resources.

### **Automation testing process:**

Following steps are followed in an Automation Process

Step 1. Test Tool Selection

Step 2. Define scope of Automation

Step 3. Planning, Design and Development

Step 4. Test Execution

Step 5. Maintenance

## **SELENIUM AUTOMATION**

Selenium is a free, open-source automation testing suite for web applications across different browsers and platforms. It is somewhat similar to HP Quick Test Pro (QTP, currently UFT). However, Selenium focuses on automating web-based applications. Testing done using Selenium is usually referred to as Selenium testing. Remember, only testing web applications is possible with Selenium. You cannot use it to test desktop applications or mobile applications.

## **7.4 SELENIUM**

Selenium is one of the most widely used open source Web UI (User Interface) automation testing suite. It was originally developed by Jason Huggins in 2004 as an internal tool at Thought Works. Selenium supports automation across different browsers, platforms and programming languages.

Selenium can be easily deployed on platforms such as Windows, Linux, Solaris and Macintosh. Moreover, it supports OS (Operating System) for mobile applications like iOS, windows mobile and android. Selenium supports a variety of programming languages through the use of drivers specific to each language.

Languages supported by Selenium include C#, Java, Perl, PHP, Python and Ruby. Currently, Selenium Web driver is most popular with Java and C#. Selenium test scripts can be coded in any of the supported programming languages and can be run directly in most modern web browsers.

Browsers supported by Selenium include Internet Explorer, Mozilla Firefox, Google Chrome and Safari.

### 7.2.1:Selenium Program:

```
package ushaproject;

import org.openqa.selenium.By;
import org.openqa.selenium.WebDriver;
import org.openqa.selenium.chrome.ChromeDriver;

public class Activity1 {

    public static void main(String[] args) throws InterruptedException {
        System.setProperty("webdriver.chrome.driver",
"C:\\\\Users\\Sachin\\Downloads\\chromedriver_win32\\chromedriver.exe");

        // Instantiate a ChromeDriver class.
        WebDriver driver = new ChromeDriver();

        // Maximize the browser
        driver.manage().window().maximize();

        driver.get("C:\\\\Users\\Sachin\\Desktop\\us\\pro\\project\\project.html");
        Thread.sleep(2000);

        driver.navigate().to("file:///C:/Users/Sachin/Desktop/us/pro/project/about.html");
        Thread.sleep(2000);

        driver.navigate().to("file:///C:/Users/Sachin/Desktop/us/pro/project/home.html");
        Thread.sleep(2000);

        driver.navigate().to("file:///C:/Users/Sachin/Desktop/us/pro/project/shipping.html");
        Thread.sleep(2000);

        driver.navigate().to("file:///C:/Users/Sachin/Desktop/us/pro/project/tracking.html");
        Thread.sleep(2000);
    }
}
```

```

driver.navigate().to("file:///C:/Users/Sachin/Desktop/us/pro/project/support.html");

Thread.sleep(2000);

//Login Page
driver.navigate().to("file:///C:/Users/Sachin/Desktop/us/pro/project/loginpage.html");

driver.findElement(By.id("login")).click();

driver.findElement(By.xpath("/html/body/section/div/form[1]/input[1]")).sendKeys("
UshaBansode");

driver.findElement(By.xpath("/html/body/section/div/form[1]/input[2]")).sendKeys("
UshaBansode@123");

driver.findElement(By.className("checkbox")).click();
driver.findElement(By.className("submit-btn")).click();

//Registration Page

driver.findElement(By.xpath("/html/body/section/div/div[1]/button[2]")).click();

driver.findElement(By.cssSelector("#register > input:nth-
child(1)")).sendKeys("UshaBansode");

driver.findElement(By.xpath("/html/body/section/div/form[2]/input[2]")).sendKeys("
ushabansode123@gmail.com");

driver.findElement(By.xpath("/html/body/section/div/form[2]/input[3]")).sendKeys("
UshaBansode123");

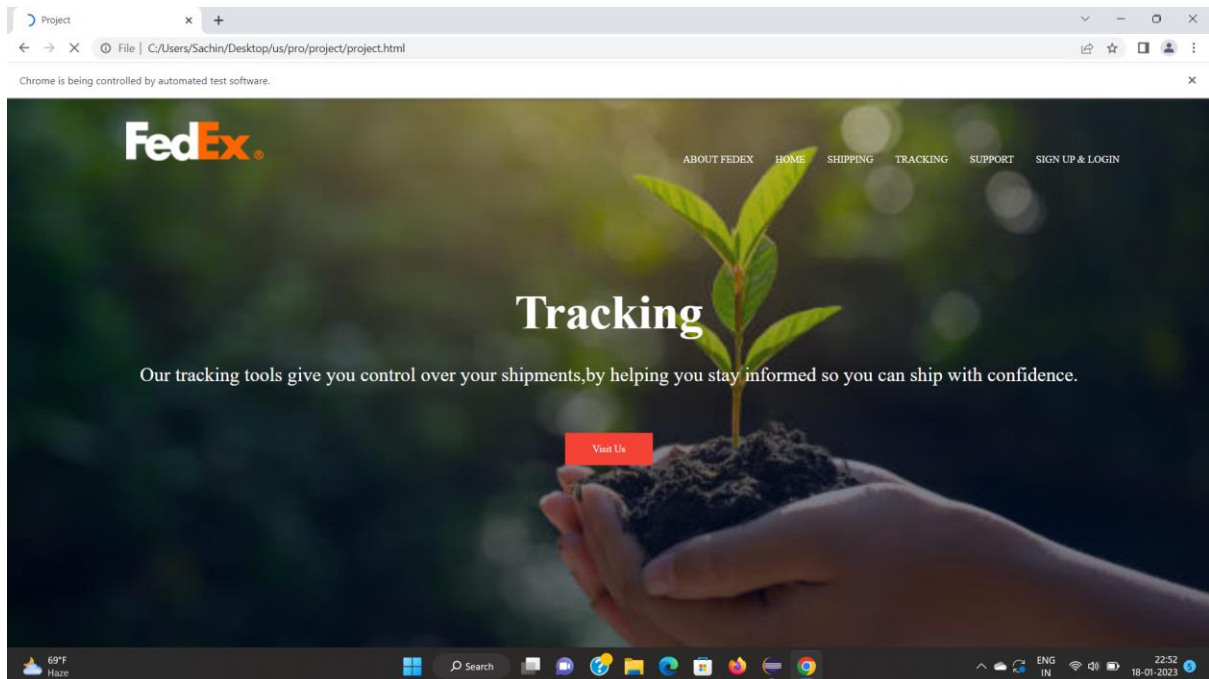

driver.findElement(By.className("checkbox")).click();
driver.findElement(By.className("submit-btn")).click();

}

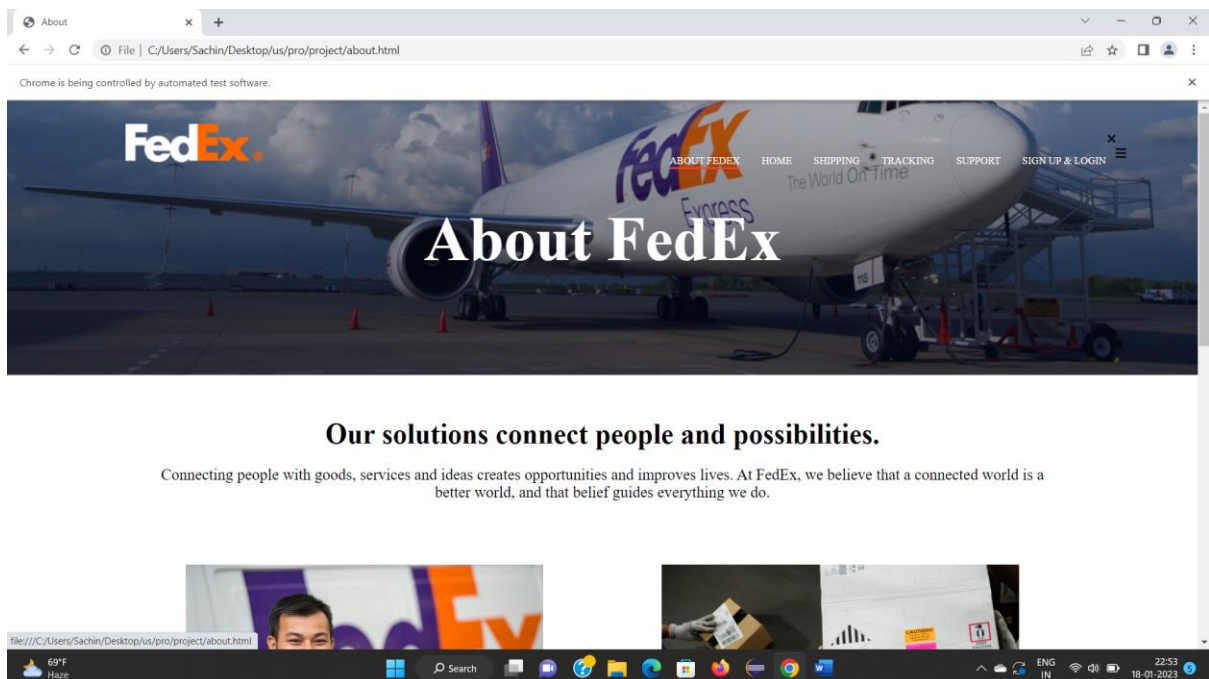

}

```

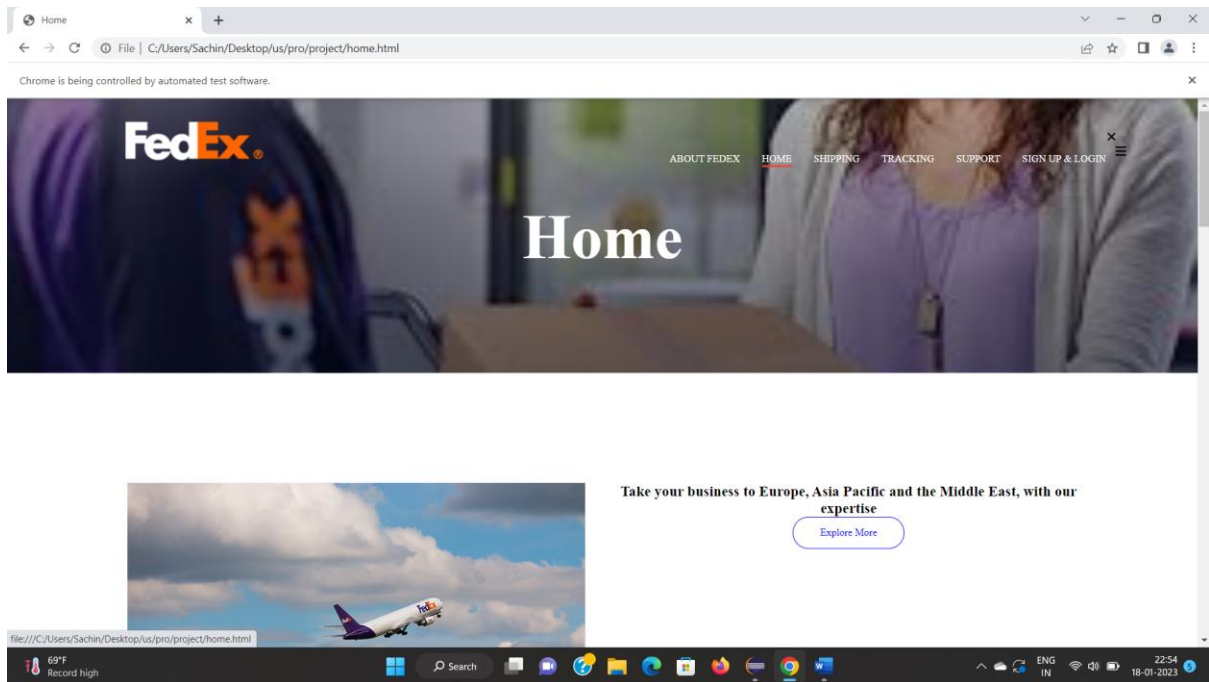

## Output of Automated testing:

### 7.4.2:Automation Testing on Edubridge Portal:

```
package ushaproject;

import org.openqa.selenium.By;
import org.openqa.selenium.WebDriver;
import org.openqa.selenium.chrome.ChromeDriver;

public class Activity1 {

    public static void main(String[] args) {
System.setProperty("webdriver.chrome.driver",
"C:\\\\Users\\Sachin\\Downloads\\chromedriver_win32\\chromedriver.exe");

        // Instantiate a ChromeDriver class.
        WebDriver driver = new ChromeDriver();

        // Maximize the browser
        driver.manage().window().maximize();
        driver.get("https://www.edubridgeindia.com/login");
        driver.findElement(By.id("login_mobile")).sendKeys("9309792716");
        driver.findElement(By.id("login_password")).sendKeys("Usha@123");
        driver.findElement(By.id("btnLoginSubmit")).click();

    }

}
```

## Output:

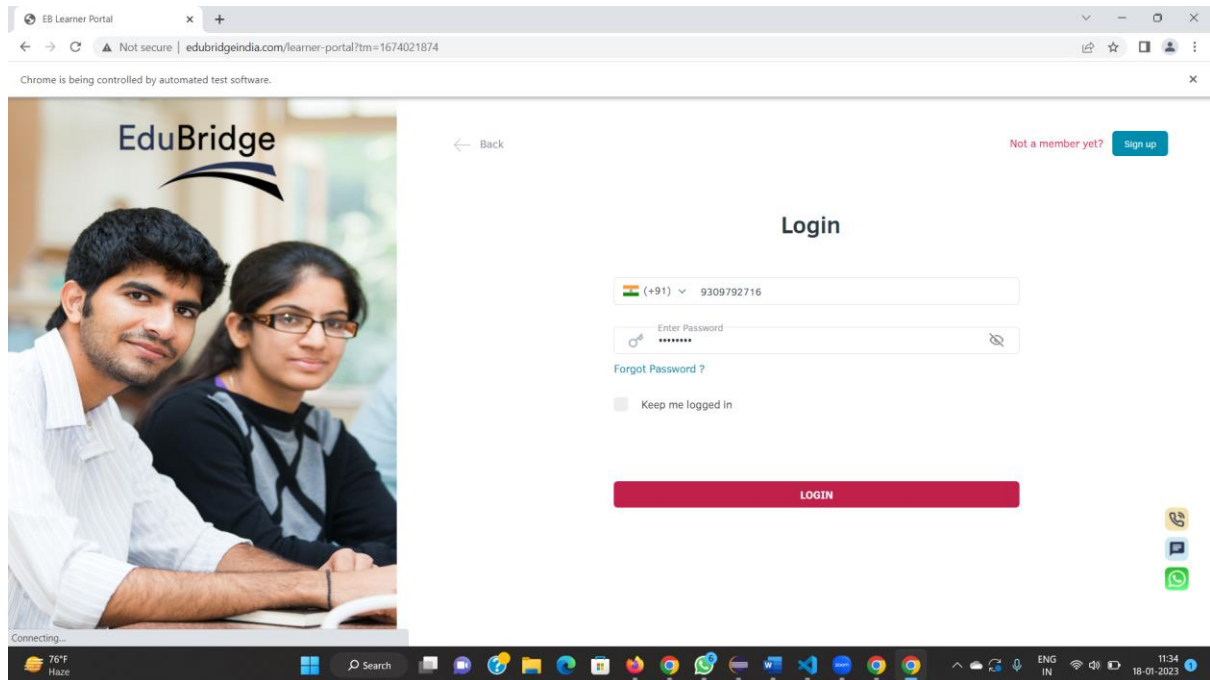

Figure 7.2.1 Login page

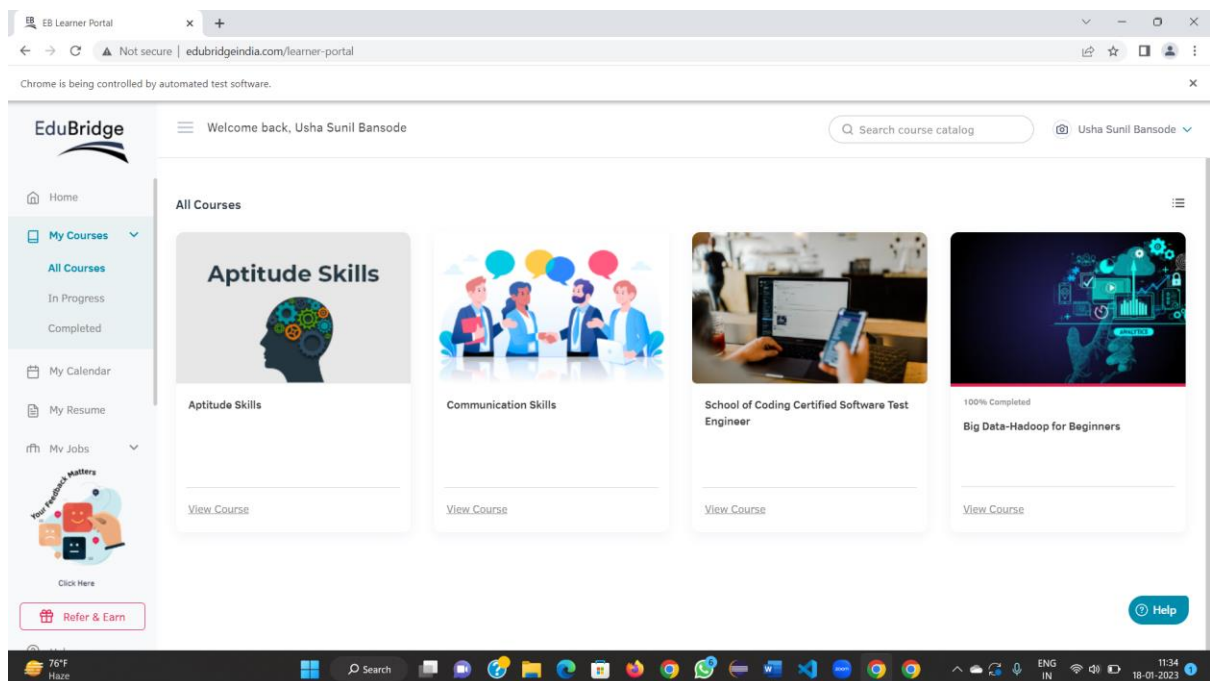

Figure 7.2.2 Edubridge portal

### 7.4.3:Cucumber:

Cucumber is a testing tool that supports Behavior Driven Development (BDD). It offers a way to write tests that anybody can understand, regardless of their technical knowledge. In BDD, users (business analysts, product owners) first write scenarios or acceptance tests that describe the behavior of the system from the customer's perspective, for review and sign-off by the product owners before developers write their codes.

#### Code

```
package runner;

import org.junit.runner.RunWith;
import io.cucumber.junit.CucumberOptions;
import io.cucumber.junit.Cucumber;

@RunWith(Cucumber.class)
@CucumberOptions(features="src/test/java",glue= {"instagramTest"})

public class Runner {

}
```

## **8. CONCLUSION**

The Courier Tracking Service System project provides user interface in to the application through an authenticated admin and also its a modern way of usage to a Courier Service through a computer system.

The main proposed system of this web application is to track the item and check the current status of the user.
